
- 0  The instruction was unconditional, or was conditional and passed its condition code check.
- 1  The instruction was conditional, and might have failed its condition code check.

**Bits [18:0]**

Reserved, RES0.
Traps to Hyp mode of Non-secure PL1 execution of SMC instructions on page G1-3933 describes the configuration settings for this trap, for instructions executed in Non-secure PL1 modes.

**ISS encoding for an exception from a Prefetch abort**

This encoding is used by:

- Prefetch Abort routed to Hyp mode.
- Prefetch Abort taken from Hyp mode.

The ISS encoding for these exceptions is:

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>11</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>10</td>
<td>FnV, bit [10]</td>
</tr>
<tr>
<td>9</td>
<td>EA, bit [9]</td>
</tr>
<tr>
<td>8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7</td>
<td>S1PTW, bit [7]</td>
</tr>
<tr>
<td>6</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>
```

**Bits [24:11]**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

- 0: HIFAR is valid.
- 1: HIFAR is not valid, and holds an UNKNOWN value.

This field is only valid when the IFSC field is 0b010000, that is it is valid only for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of external aborts.

For any abort other than an External abort this bit returns a value of 0.

**Bit [8]**

Reserved, RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a fault on the stage 2 translation of an address accessed during a stage 1 translation table walk:

- 0: Fault not on a stage 2 translation for a stage 1 translation table walk.
- 1: Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For a fault other than a stage 2 fault, this bit is RES0.

**Bit [6]**

Reserved, RES0.
IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

000000  Address size fault, translation table base register
000001  Address size fault, first level
000010  Address size fault, second level
000011  Address size fault, third level
000101  Translation fault, first level
000110  Translation fault, second level
000111  Translation fault, third level
001001  Access flag fault, first level
001010  Access flag fault, second level
001011  Access flag fault, third level
001101  Permission fault, first level
001110  Permission fault, second level
001111  Permission fault, third level
010000  Synchronous external abort, not on translation table walk
011000  Synchronous parity or ECC error on memory access, not on translation table walk
010101  Synchronous external abort on translation table walk, first level
010110  Synchronous external abort on translation table walk, second level
010111  Synchronous external abort on translation table walk, third level
011101  Synchronous parity or ECC error on memory access on translation table walk, first level
011110  Synchronous parity or ECC error on memory access on translation table walk, second level
011111  Synchronous parity or ECC error on memory access on translation table walk, third level
100001  Alignment fault
100010  Debug event, only when the EC value is 0b100001
110000  TLB conflict abort

All other values are reserved.

The lookup level associated with a fault is:

• For a fault generated on a translation table walk, the lookup level of the walk being performed.

• For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a level 1 fault.

• For an Access flag fault, the lookup level of the translation table that gave the fault.

• For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at the zeroth level.
The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value \(0b100000\):

- *Abort exceptions, when HCR.TGE is set to 1* on page G1-3858.
- *Routing debug exceptions to EL2* on page G1-3858.

### ISS encoding for an exception from an Illegal state or PC alignment fault

This encoding is used by:

- Illegal state exception taken to AArch32 state.
- PC alignment fault exception.

The ISS encoding for these exceptions is:

```
  24 23 22 21 20 19  16 15 14 13  11 10  9  8  7  6  5  0
SAS SRT RES0 DFSC
```

**Bits [24:0]**

Reserved, RES0.

For more information about the Illegal state exception, see:

- *Illegal changes to PSTATE.M* on page G1-3836.
- *Illegal return events from AArch32 state* on page G1-3861.
- *Legal returns that set PSTATE.IE to 1* on page G1-3863.
- *The Illegal Execution State exception* on page G1-3863.

For more information about the PC alignment fault exception, see *Branching to an unaligned PC* on page J1-5364.

### ISS encoding for an exception from a Data abort

This encoding is used by:

- Data Abort routed to Hyp mode.
- Data Abort taken from Hyp mode.

The ISS encoding for these exceptions is:

```
  24 23 22 21 20 19  16 15 14 13  11 10  9  8  7  6  5  0
SAS SRT RES0 DFSC
```

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

\[0\] No valid instruction syndrome. ISS[23:14] are RES0.
This bit is 0 for all faults except those generated by a stage 2 translation. For Data Abort exceptions generated by a stage 2 translation, this bit is 1 and a valid instruction syndrome is returned, only if all of the following are true:

- The instruction that generated the Data Abort exception:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLH, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using the PC as a source or destination register.

For ISS reporting, a stage 2 abort on a stage 1 translation table lookup is treated as a stage 1 Translation fault, and does not return a valid instruction syndrome.

It is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous external abort on stage 2 translation table walks.

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

**SAS, bits [23:22]**

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

- 00 Byte
- 01 Halfword
- 10 Word
- 11 Doubleword

This field is RES0 when the value of ISV is 0.

**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

- 0 Sign-extension not required.
- 1 Data item must be sign-extended.

For all other operations this bit is 0.

This field is RES0 when the value of ISV is 0.

**Bit [20]**

Reserved, RES0.

**SRT, bits [19:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction, as viewed in AArch64 state.

This field is RES0 when the value of ISV is 0.

**Bit [15]**

Reserved, RES0.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

- 0 Instruction did not have acquire/release semantics.
- 1 Instruction did have acquire/release semantics.

This field is RES0 when the value of ISV is 0.
Bits [13:11]
Reserved, RES0.

FnV, bit [10]
FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.
0 HDFAR is valid.
1 HDFAR is not valid, and holds an UNKNOWN value.
This field is only valid when the DFSC field is 0b010000, that is it is valid only for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

EA, bit [9]
External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of external aborts.
For any abort other than an External abort this bit returns a value of 0.

CM, bit [8]
Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation operation. For synchronous faults, the possible values of this bit are:
0 Fault not generated by a cache maintenance or address translation operation.
1 Fault generated by a cache maintenance or address translation operation.
For asynchronous faults, this bit is 0.

S1PTW, bit [7]
For a stage 2 fault, indicates whether the fault was a fault on the stage 2 translation of an address accessed during a stage 1 translation table walk:
0 Fault not on a stage 2 translation for a stage 1 translation table walk.
1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.
For a fault other than a stage 2 fault, this bit is RES0.

WnR, bit [6]
Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction. The possible values of this bit are:
0 Abort caused by a read instruction.
1 Abort caused by a write instruction.
For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.
For an asynchronous Data Abort exception this bit is UNKNOWN.

DFSC, bits [5:0]
Data Fault Status Code. Possible values of this field are:
000000 Address size fault, translation table base register
000001 Address size fault, first level
000010 Address size fault, second level
000011 Address size fault, third level
000101 Translation fault, first level
000110 Translation fault, second level
000111 Translation fault, third level
001001 Access flag fault, first level
The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a level 1 fault.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at the zeroth level.

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100010:

- Abort exceptions, when HCR.TGE is set to 1 on page G1-3858.
- Routing debug exceptions to EL2 on page G1-3858.

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of 0b100000 or 0b100100:

- Hyp mode control of Non-secure access permissions on page G4-4118.
• Memory fault reporting in Hyp mode on page G4-4175.

Accessing the HSR:

To access the HSR:

MRC p15,4,<Rt>,c5,c2,0 ; Read HSR into Rt
MCR p15,4,<Rt>,c5,c2,0 ; Write Rt to HSR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>0101</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
**G6.2.68  HSTR, Hyp System Trap Register**

The HSTR characteristics are:

**Purpose**

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to the CP15 primary coprocessor registers, \{c0-c3,c5-c13,c15\} using MCR, MRC, MCRR, and MRRC instructions.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

**Configurations**

AArch32 System register HSTR is architecturally mapped to AArch64 System register HSTR_EL2. If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

HSTR is a 32-bit register.

**Field descriptions**

The HSTR bit assignments are:
Bits [31:16]

Reserved, RES0.

T<n>, bit [n], for n = 0 to 15

HSTR.{T0-T3, T5-T13, T15} trap Non-secure PL0 and PL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the CP15 System registers, by the accessed primary CP15 register number, {c0-c3, c5-c13, c15}.

0    This control has no effect on Non-secure PL0 or PL1 accesses to the CP15 System registers.

1    Any Non-secure PL1 MCR, MRC, MCRR, or MRRC access to a corresponding register is trapped to Hyp mode.

A Non-secure PL0 MCR, MRC, MCRR, or MRRC access to the corresponding CP15 System register is trapped to Hyp mode only if it is not UNDEFINED when this bit is zero.

The primary CP15 register number is the value of <CRn> for an MCR or MRC instruction, or the value of <CRm> for an MCRR or MRRC instruction.

For example, when HSTR.T7 is 1:

- Any 32-bit CP15 access from a Non-secure PL1 mode, using an MCR or MRC instruction with <CRn> set to c7, is trapped to Hyp mode.
- Any 64-bit CP15 access from a Non-secure PL1 mode, using an MCRR or MRRC instruction with <CRm> set to c7, is trapped to Hyp mode.

Fields T4 and T14 are RES0.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the HSTR:

To access the HSTR:

MRC p15,4,<Rt>,c1,c1,3 ; Read HSTR into Rt
MCR p15,4,<Rt>,c1,c1,3 ; Write Rt to HSTR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>0001</td>
<td>0001</td>
<td>011</td>
</tr>
</tbody>
</table>
G6.2.69   HTCR, Hyp Translation Control Register

The HTCR characteristics are:

**Purpose**

Controls translation table walks required for the stage 1 translation of memory accesses from Hyp mode, and holds cacheability and shareability information for the accesses.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

Used in conjunction with HTTBR, that defines the translation table base address for the translations.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HTCR is architecturally mapped to AArch64 System register TCR_EL2. If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

HTCR is a 32-bit register.

**Field descriptions**

The HTCR bit assignments are:
Bit [31]
Reserved, RES1.

IMP DEF, bit [30]
IMPLEMENTATION DEFINED.

Bits [29:24]
Reserved, RES0.

Bit [23]
Reserved, RES1.

Bits [22:14]
Reserved, RES0.

SH0, bits [13:12]
Shareability attribute for memory associated with translation table walks using HTTBR.

00 Non-shareable
10 Outer Shareable
11 Inner Shareable
Other values are reserved.

ORGN0, bits [11:10]
Outer cacheability attribute for memory associated with translation table walks using HTTBR.

00 Normal memory, Outer Non-cacheable
01 Normal memory, Outer Write-Back Write-Allocate Cacheable
10 Normal memory, Outer Write-Through Cacheable
11 Normal memory, Outer Write-Back no Write-Allocate Cacheable

IRGN0, bits [9:8]
Inner cacheability attribute for memory associated with translation table walks using HTTBR.

00 Normal memory, Inner Non-cacheable
01 Normal memory, Inner Write-Back Write-Allocate Cacheable
10 Normal memory, Inner Write-Through Cacheable
11 Normal memory, Inner Write-Back no Write-Allocate Cacheable

Bits [7:3]
Reserved, RES0.

T0SZ, bits [2:0]
The size offset of the memory region addressed by HTTBR. The region size is 2^{32-T0SZ} bytes.

Accessing the HTCR:

To access the HTCR:

MRC p15,4,<Rt>,c2,c0,2 ; Read HTCR into Rt
MCR p15,4,<Rt>,c2,c0,2 ; Write Rt to HTCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>0010</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.70   HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

**Purpose**

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

The PE never updates this register. This means the register is always **UNKNOWN** on reset.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HSTR.T13`=1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If `HSTR_EL2.T13`=1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HTPIDR is architecturally mapped to AArch64 System register TPIDR_EL2[31:0].

If EL2 is not implemented, this register is **RES0** from EL3.

**Attributes**

HTPIDR is a 32-bit register.

**Field descriptions**

The HTPIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Thread ID</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Thread ID. Thread identifying information stored by software running at this Exception level.
Accessing the HTPIDR:

To access the HTPIDR:

MRC p15,4,<Rt>,c13,c0,2 ; Read HTPIDR into Rt
MCR p15,4,<Rt>,c13,c0,2 ; Write Rt to HTPIDR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1101</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.71  HTTBR, Hyp Translation Table Base Register

The HTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the stage 1 translation of memory accesses from Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

Used in conjunction with the HTCR.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HTTBR is architecturally mapped to AArch64 System register TTBR0_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

HTTBR is a 64-bit register.

**Field descriptions**

The HTTBR bit assignments are:

```
63 48 47
<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
RES0 | BADDR |
```

Bits [63:48]

Reserved, RES0.
BADDR, bits [47:0]

Translation table base address, bits[47:x], Bits [x-1:0] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of HTCR.T0SZ as follows:

- If HTCR.T0SZ is 0 or 1, x = 5 - HTCR.T0SZ.
- If HTCR.T0SZ is greater than 1, x = 14 - HTCR.T0SZ.

If bits[47:40] of the Translation table base address are not zero, an Address size fault is generated.

Accessing the HTTBR:

To access the HTTBR:

MRRC p15,4,<Rt>,<Rt2>,c2 ; Read HTTBR[31:0] into Rt and HTTBR[63:32] into Rt2
MCRR p15,4,<Rt>,<Rt2>,c2 ; Write Rt to HTTBR[31:0] and Rt2 to HTTBR[63:32]

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0100</td>
<td>0010</td>
</tr>
</tbody>
</table>
G6.2.72  HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

**Purpose**

Holds the vector base address for any exception that is taken to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>RW</td>
<td>RW</td>
<td></td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register HVBAR is architecturally mapped to AArch64 System register VBAR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

HVBAR is a 32-bit register.

**Field descriptions**

The HVBAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>5</th>
<th>4</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:5]**

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

**Bits [4:0]**

Reserved, RES0.
Accessing the HVBAR:

To access the HVBAR:

MRC p15,4,<Rt>,c12,c0,0 ; Read HVBAR into Rt
MCR p15,4,<Rt>,c12,c0,0 ; Write Rt to HVBAR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1100</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
### G6.2.73  ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

**Purpose**

Invalidate all instruction caches to PoU. If branch predictors are architecturally visible, also flush branch predictors.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TPU==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
If HCR_EL2.TPU==1, Non-secure PL1 execution of this instruction is trapped to EL2.
If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch32 System operation ICIALLU performs the same function as AArch64 System operation IC IALLU.

**Attributes**

ICIALLU is a 32-bit system operation.

**Field descriptions**

The ICIALLU operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

**Performing the ICIALLU operation:**

To perform the ICIALLU operation:

MCR p15,0,<Rt>,c7,c5,0 ; ICIALLU operation, ignoring the value in Rt
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0111</td>
<td>0101</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.74 ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

Purpose

Invalidate all instruction caches Inner Shareable to PoU. If branch predictors are architecturally visible, also flush branch predictors.

Usage constraints

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TPU==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
If HCR_EL2.TPU==1, Non-secure PL1 execution of this instruction is trapped to EL2.
If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

Configurations

AArch32 System operation ICIALLUIS performs the same function as AArch64 System operation IC IALLUIS.

Attributes

ICIALLUIS is a 32-bit system operation.

Field descriptions

The ICIALLUIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

Performing the ICIALLUIS operation:

To perform the ICIALLUIS operation:

MCR p15,0,<Rt>,c7,c1,0 ; ICIALLUIS operation, ignoring the value in Rt
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0111</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.75 ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

**Purpose**

Invalidate instruction cache line by virtual address to PoU.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TPU==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TPU==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T7==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T7==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

AArch32 System operation ICIMVAU performs the same function as AArch64 System operation IC IVAU.

**Attributes**

ICIMVAU is a 32-bit system operation.

**Field descriptions**

The ICIMVAU input value bit assignments are:

```
31 0
```

Virtual address to use

Bits [31:0]

Virtual address to use.

**Performing the ICIMVAU operation:**

To perform the ICIMVAU operation:
MCR pl5,0,<Rt>,c7,c5,1 ; ICIMVAU operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0111</td>
<td>0101</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.76 ID_AFR0, Auxiliary Feature Register 0

The ID_AFR0 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with the Main ID Register, MIDR.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
If HISTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
If HISTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register ID_AFR0 is architecturally mapped to AArch64 System register ID_AFR0_EL1.

Attributes

ID_AFR0 is a 32-bit register.

Field descriptions

The ID_AFR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
</tr>
</tbody>
</table>
Bits [31:16]
Reserved, RES0.

IMPLEMENTATION DEFINED, bits [15:12]
IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [11:8]
IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [7:4]
IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [3:0]
IMPLEMENTATION DEFINED.

**Accessing the ID_AFR0:**

To access the ID_AFR0:

MRC p15,0,<Rt>,c0,c1,3 ; Read ID_AFR0 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0001</td>
<td>011</td>
</tr>
</tbody>
</table>
G6.2.77 ID_DFR0, Debug Feature Register 0

The ID_DFR0 characteristics are:

**Purpose**
Provides top level information about the debug system in AArch32.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with the Main ID Register, MIDR.

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**
There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_DFR0 is architecturally mapped to AArch64 System register ID_DFR0_EL1.

**Attributes**
ID_DFR0 is a 32-bit register.

**Field descriptions**
The ID_DFR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PerfMon</td>
<td>MProfDbg</td>
<td>MMapTrc</td>
<td>CopTrc</td>
<td>MMapDbg</td>
<td>CopSDbg</td>
<td>CopDbg</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:28]**
Reserved, RES0.
PerfMon, bits [27:24]

Performance Monitors. Support for coprocessor-based ARM Performance Monitors Extension, for A and R profile processors. Defined values are:

0000  Performance Monitors Extension system registers not implemented.
0001  Support for Performance Monitors Extension version 1 (PMUv1) system registers.
0010  Support for Performance Monitors Extension version 2 (PMUv2) system registers.
0011  Support for Performance Monitors Extension version 3 (PMUv3) system registers.
1111  IMPLEMENTATION DEFINED form of Performance Monitors system registers supported. PMUv3 not supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000, 0011, and 1111.

In ARMv7, the value 0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an ARMv8 implementation.

MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

0000  Not supported.
0001  Support for M profile Debug architecture, with memory-mapped access.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

MMapTrc, bits [19:16]

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

0000  Not supported.
0001  Support for ARM trace architecture, with memory-mapped access.

All other values are reserved.

In ARMv8-A the permitted values are 0000, and 0001.

In the Trace registers, the ETMIDR gives more information about the implementation.

CopTrc, bits [15:12]

Coprocessor Trace. Support for coprocessor-based trace model. Defined values are:

0000  Not supported.
0001  Support for ARM trace architecture, with CP14 access.

All other values are reserved.

In ARMv8-A the permitted values are 0000, and 0001.

In the Trace registers, the ETMIDR gives more information about the implementation.

MMapDbg, bits [11:8]

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In ARMv8-A this field is RES0.

The optional memory map defined by ARMv8 is not compatible with ARMv7.

CopSDbg, bits [7:4]

Coprocessor Secure Debug. Support for a Secure debug model accessed through a conceptual coprocessor, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-Secure state, this field is RES0.

Otherwise, this field reads the same as bits [3:0].
CopDbg, bits [3:0]

Coprocessor Debug. Support for coprocessor based debug model, for A and R profile processors.
Defined values are:

0000    Not supported.
0010    Support for ARMv6, v6 Debug architecture, with CP14 access.
0011    Support for ARMv6, v6.1 Debug architecture, with CP14 access.
0100    Support for ARMv7, v7 Debug architecture, with CP14 access.
0101    Support for ARMv7, v7.1 Debug architecture, with CP14 access.
0110    Support for ARMv8 debug architecture, with CP14 access.

All other values are reserved.
In ARMv8-A the permitted values are 0000, and 0110.

Accessing the ID_DFR0:

To access the ID_DFR0:

MRC p15,0,<Rt>,c0,c1,2 ; Read ID_DFR0 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0001</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.78   ID_ISAR0, Instruction Set Attribute Register 0

The ID_ISAR0 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_ISAR0 is architecturally mapped to AArch64 System register ID_ISAR0_EL1.

**Attributes**

ID_ISAR0 is a 32-bit register.

**Field descriptions**

The ID_ISAR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Divide</td>
<td>Debug</td>
<td>Coproc</td>
<td>CmpBranch</td>
<td>BitField</td>
<td>BitCount</td>
<td>Swap</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.
Divide, bits [27:24]  
Indicates the implemented Divide instructions. Defined values are:  
0000 None implemented.  
0001 Adds SDIV and UDIV in the T32 instruction set.  
0010 As for 0001, and adds SDIV and UDIV in the A32 instruction set.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0010.

Debug, bits [23:20]  
Indicates the implemented Debug instructions. Defined values are:  
0000 None implemented.  
0001 Adds BKPT.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.

Coproc, bits [19:16]  
Indicates the implemented Coprocessor instructions. Defined values are:  
0000 None implemented, except for instructions separately attributed by the architecture, including CP15, CP14, and Advanced SIMD and VFP.  
0001 Adds generic CDP, LDC, MCR, MRC, and STC.  
0010 As for 0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.  
0011 As for 0010, and adds generic MCRR and MRRC.  
0100 As for 0011, and adds generic MCRR2 and MRRC2.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0000.

CmpBranch, bits [15:12]  
Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:  
0000 None implemented.  
0001 Adds CBNZ and CBZ.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.

BitField, bits [11:8]  
Indicates the implemented BitField instructions. Defined values are:  
0000 None implemented.  
0001 Adds BFC, BFI, SBFX, and UBFX.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.

BitCount, bits [7:4]  
Indicates the implemented Bit Counting instructions. Defined values are:  
0000 None implemented.  
0001 Adds CLZ.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.
Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

0000  None implemented.
0001  Adds SWP and SWPB.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

Accessing the ID_ISAR0:

To access the ID_ISAR0:

MRC p15,0,<Rt>,c0,c2,0 ; Read ID_ISAR0 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.79  ID_ISAR1, Instruction Set Attribute Register 1

The ID_ISAR1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_ISAR0, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_ISAR1 is architecturally mapped to AArch64 System register ID_ISAR1_EL1.

Attributes

ID_ISAR1 is a 32-bit register.

Field descriptions

The ID_ISAR1 bit assignments are:

<table>
<thead>
<tr>
<th>31 28 27 24 23 20 19 16 15 12 11 8 7 4 3 0</th>
<th>Jazelle Interwork Immediate IfThen Extend Except_AR Except Endian</th>
</tr>
</thead>
</table>

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

- 0000  No support for Jazelle.
0001  Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**Interwork, bits [27:24]**
Indicates the implemented Interworking instructions. Defined values are:

- 0000  None implemented.
- 0001  Adds the BX instruction, and the T bit in the PSR.
- 0010  As for 0001, and adds the BLX instruction. PC loads have BX-like behavior.
- 0011  As for 0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.
In ARMv8-A the only permitted value is 0011.

**Immediate, bits [23:20]**
Indicates the implemented data-processing instructions with long immediates. Defined values are:

- 0000  None implemented.
- 0001  Adds:
  - The MOVT instruction.
  - The MOV instruction encodings with zero-extended 16-bit immediates.
  - The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**IfThen, bits [19:16]**
Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

- 0000  None implemented.
- 0001  Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**Extend, bits [15:12]**
Indicates the implemented Extend instructions. Defined values are:

- 0000  No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
- 0001  Adds the SXTB, SXTH, UXTB, and UXTH instructions.
- 0010  As for 0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.
In ARMv8-A the only permitted value is 0010.

**Except_AR, bits [11:8]**
Indicates the implemented A and R profile exception-handling instructions. Defined values are:

- 0000  None implemented.
- 0001  Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**Except, bits [7:4]**
Indicates the implemented exception-handling instructions in the ARM instruction set. Defined values are:

- **0000** Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
- **0001** Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**Endian, bits [3:0]**
Indicates the implemented Endian instructions. Defined values are:

- **0000** None implemented.
- **0001** Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.

**Accessing the ID_ISAR1:**

To access the ID_ISAR1:

\[
\text{MRC p15,0,}<\text{Rt}>,c0,c2,1 \text{; Read ID_ISAR1 into Rt}
\]

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.80  ID_ISAR2, Instruction Set Attribute Register 2

The ID_ISAR2 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_ISAR2 is architecturally mapped to AArch64 System register ID_ISAR2_EL1.

**Attributes**

ID_ISAR2 is a 32-bit register.

**Field descriptions**

The ID_ISAR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reversal</td>
<td>PSR_AR</td>
<td>MultiU</td>
<td>MultiS</td>
<td>Multi</td>
<td>MemHint</td>
<td>LoadStore</td>
<td>MultiAccessInt</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Reversal, bits [31:28]
Indicates the implemented Reversal instructions. Defined values are:

- **0000**: None implemented.
- **0001**: Adds the REV, REV16, and REVSH instructions.
- **0010**: As for 0001, and adds the RBIT instruction.

All other values are reserved.
In ARMv8-A the only permitted value is **0010**.

PSR_AR, bits [27:24]
Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

- **0000**: None implemented.
- **0001**: Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.
In ARMv8-A the only permitted value is **0001**.

The exception return forms of the data-processing instructions are:
- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]
Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

- **0000**: None implemented.
- **0001**: Adds the UMULL and UMLAL instructions.
- **0010**: As for 0001, and adds the UMAAL instruction.

All other values are reserved.
In ARMv8-A the only permitted value is **0010**.

MultS, bits [19:16]
Indicates the implemented advanced signed Multiply instructions. Defined values are:

- **0000**: None implemented.
- **0001**: Adds the SMULL and SMLAL instructions.
- **0010**: As for 0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
- **0011**: As for 0010, and adds the SMLAD, SMLADX, SMLADL, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.
In ARMv8-A the only permitted value is **0011**.

Mult, bits [15:12]
Indicates the implemented additional Multiply instructions. Defined values are:

- **0000**: No additional instructions implemented. This means only MUL is implemented.
- **0001**: Adds the MLA instruction.
- **0010**: As for 0001, and adds the MLS instruction.

All other values are reserved.
In ARMv8-A the only permitted value is **0010**.
MultiAccessInt, bits [11:8]
Indicates the support for interruptible multi-access instructions. Defined values are:
0000   No support. This means the LDM and STM instructions are not interruptible.
0001   LDM and STM instructions are restartable.
0010   LDM and STM instructions are continuable.
All other values are reserved.
In ARMv8-A the only permitted value is 0000.

MemHint, bits [7:4]
Indicates the implemented Memory Hint instructions. Defined values are:
0000   None implemented.
0001   Adds the PLD instruction.
0010   Adds the PLD instruction. (0001 and 0010 have identical effects.)
0011   As for 0001 (or 0010), and adds the PLI instruction.
0100   As for 0011, and adds the PLW instruction.
All other values are reserved.
In ARMv8-A the only permitted value is 0100.

LoadStore, bits [3:0]
Indicates the implemented additional load/store instructions. Defined values are:
0000   No additional load/store instructions implemented.
0001   Adds the LDRD and STRD instructions.
0010   As for 0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.
All other values are reserved.
In ARMv8-A the only permitted value is 0010.

Accessing the ID_ISAR2:
To access the ID_ISAR2:
MRC p15,0,<Rt>,c0,c2,2 ; Read ID_ISAR2 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>

<td>010</td>
</tr>
</tbody>
</table>
ID_ISAR3, Instruction Set Attribute Register 3

The ID_ISAR3 characteristics are:

Purpose
Provides information about the instruction sets implemented by the PE in AArch32.

Usage constraints
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR4, and ID_ISAR5.

Traps and Enables
For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

Configurations
There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_ISAR3 is architecturally mapped to AArch64 System register ID_ISAR3_EL1.

Attributes
ID_ISAR3 is a 32-bit register.

Field descriptions
The ID_ISAR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>T32EE</td>
<td>TrueNOP</td>
<td>T32Copy</td>
<td>TabBranch</td>
<td>SynchPrim</td>
<td>SVC</td>
<td>SIMD</td>
<td>Saturate</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

T32EE, bits [31:28]
Indicates the implemented T32EE instructions. Defined values are:

0000 None implemented.
0001  Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**TrueNOP, bits [27:24]**

Indicates the implemented True NOP instructions. Defined values are:

0000  None implemented. This means there are no NOP instructions that do not have any register dependencies.

0001  Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**T32Copy, bits [23:20]**

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

0000  Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.

0001  Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**TabBranch, bits [19:16]**

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

0000  None implemented.

0001  Adds the TBB and TBH instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**SynchPrim, bits [15:12]**

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

0000  If SynchPrim_frac == 0000, no Synchronization Primitives implemented.

0001  If SynchPrim_frac == 0000, adds the LDREX and STREX instructions.

0010  If SynchPrim_frac == 0000, as for [0001, 0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In ARMv8-A the only permitted value is 0010.

**SVC, bits [11:8]**

Indicates the implemented SVC instructions. Defined values are:

0000  Not implemented.

0001  Adds the SVC instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.
SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

- **0000**: None implemented.
- **0001**: Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
- **0011**: As for 0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

- **0000**: None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
- **0001**: Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

Accessing the ID_ISAR3:

To access the ID_ISAR3:

\[ \text{MRC p15,0,<Rt>,c0,c2,3} \] ; Read ID_ISAR3 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR5.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_ISAR4 is architecturally mapped to AArch64 System register ID_ISAR4_EL1.

**Attributes**

ID_ISAR4 is a 32-bit register.

**Field descriptions**

The ID_ISAR4 bit assignments are:

| 31 28 27 24 23 20 19 16 15 12 11 8 7 4 3 0 |
|-----------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| SWP_frac  PSR_M  Barrier  SMC  Writeback  WithShifts  Unpriv  SynchPrm_frac |
SWP_frac, bits [31:28]
Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

0000  SWP or SWPB instructions not implemented.
0001  SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if the ID_ISAR0.Swap_instrs field is 0000.
In ARMv8-A the only permitted value is 0000.

PSR_M, bits [27:24]
Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

0000  None implemented.
0001  Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

SynchPrim_frac, bits [23:20]
Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

0000  If SynchPrim == 0000, no Synchronization Primitives implemented. If SynchPrim == 0001, adds the LDREX and STREX instructions. If SynchPrim == 0010, also adds the CLREX, LDREXB, LDREXH, STREXH, STREXB, LDREXD, and STREXD instructions.
0011  If SynchPrim == 0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.
In ARMv8-A the only permitted value is 0000.

Barrier, bits [19:16]
Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

0000  None implemented. Barrier operations are provided only as CP15 operations.
0001  Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

SMC, bits [15:12]
Indicates the implemented SMC instructions. Defined values are:

0000  None implemented.
0001  Adds the SMC instruction.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

Writeback, bits [11:8]
Indicates the support for Writeback addressing modes. Defined values are:

0000  Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0001  Adds support for all of the writeback addressing modes.
All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**WithShifts, bits [7:4]**

Indicates the support for instructions with shifts. Defined values are:

- **0000**: Nonzero shifts supported only in MOV and shift instructions.
- **0001**: Adds support for shifts of loads and stores over the range LSL 0-3.
- **0011**: As for 0001, and adds support for other constant shift options, both on load/store and other instructions.
- **0100**: As for 0011, and adds support for register-controlled shift options.

All other values are reserved.

In ARMv8-A the only permitted value is 0100.

**Unpriv, bits [3:0]**

Indicates the implemented unprivileged instructions. Defined values are:

- **0000**: None implemented. No T variant instructions are implemented.
- **0001**: Adds the LDRBT, LDRT, STRBT, and STRT instructions.
- **0010**: As for 0001, and adds the LDRHT, LDRTSBT, LDRTSHT, and STRHT instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

**Accessing the ID_ISAR4:**

To access the ID_ISAR4:

```
MRC p15,0,<Rt>,c0,c2,4 ; Read ID_ISAR4 into Rt
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>100</td>
</tr>
</tbody>
</table>
G6.2.83 ID_ISAR5, Instruction Set Attribute Register 5

The ID_ISAR5 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>

</table>

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR4.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_ISAR5 is architecturally mapped to AArch64 System register ID_ISAR5_EL1.

Attributes

ID_ISAR5 is a 32-bit register.

Field descriptions

The ID_ISAR5 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>CRC32</td>
<td>SHA2</td>
<td>SHA1</td>
<td>AES</td>
<td>SEVL</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:20]

Reserved, RES0.
CRC32, bits [19:16]
Indicates whether CRC32 instructions are implemented in AArch32.

0000  No CRC32 instructions implemented.
0001  CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.

SHA2, bits [15:12]
Indicates whether SHA2 instructions are implemented in AArch32.

0000  No SHA2 instructions implemented.
0001  SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.

SHA1, bits [11:8]
Indicates whether SHA1 instructions are implemented in AArch32.

0000  No SHA1 instructions implemented.
0001  SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.

AES, bits [7:4]
Indicates whether AES instructions are implemented in AArch32.

0000  No AES instructions implemented.
0001  AESE, AESD, AESMC, and AESIMC implemented.
0010  As for 0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0010.

SEVL, bits [3:0]
Indicates whether the SEVL instruction is implemented in AArch32.

0000  SEVL is implemented as a NOP.
0001  SEVL is implemented as Send Event Local.

In ARMv8-A the only permitted value is 0001.

Accessing the ID_ISAR5:

To access the ID_ISAR5:

MRC p15,0,<Rt>,c0,c2,5 ; Read ID_ISAR5 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>

</tbody>
</table>
ID_MMFR0, Memory Model Feature Register 0

The ID_MMFR0 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_MMFR1, ID_MMFR2, and ID_MMFR3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_MMFR0 is architecturally mapped to AArch64 System register ID_MMFR0_EL1.

**Attributes**

ID_MMFR0 is a 32-bit register.

**Field descriptions**

The ID_MMFR0 bit assignments are:

| 31 | 28 | 27 | 24 | 23 | 20 | 19 | 16 | 15 | 12 | 11 | 8 | 7 | 4 | 3 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|
| InnerShr | FCSE | AuxReg | TCM | ShareLvl | OuterShr | PMSA | VMSA |
**InnerShr, bits [31:28]**

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

- **0000**: Implemented as Non-cacheable.
- **0001**: Implemented with hardware coherency support.
- **1111**: Shareability ignored.

All other values are reserved.

In ARMv8-A the permitted values are **0000**, **0001**, and **1111**.

This field is valid only if the implementation distinguishes between Inner Shareable and Outer Shareable, by implementing two levels of shareability, as indicated by the value of the Shareability levels field, bits[15:12].

When the Shareability level field is zero, this field is UNK.

**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

- **0000**: Not supported.
- **0001**: Support for FCSE.

All other values are reserved.

In ARMv8-A the only permitted value is **0000**.

**AuxReg, bits [23:20]**

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

- **0000**: None supported.
- **0001**: Support for Auxiliary Control Register only.
- **0010**: Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

In ARMv8-A the only permitted value is **0010**.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

**TCM, bits [19:16]**

Indicates support for TCMs and associated DMAs. Defined values are:

- **0000**: Not supported.
- **0001**: Support is IMPLEMENTATION DEFINED. ARMv7 requires this setting.
- **0010**: Support for TCM only, ARMv6 implementation.
- **0011**: Support for TCM and DMA, ARMv6 implementation.

All other values are reserved.

In ARMv8-A the only permitted value is **0000**.

**ShareLvl, bits [15:12]**

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

- **0000**: One level of shareability implemented.
- **0001**: Two levels of shareability implemented.

All other values are reserved.

In ARMv8-A the only permitted value is **0001**.
OuterShr, bits [11:8]
Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

- 0000  Implemented as Non-cacheable.
- 0001  Implemented with hardware coherency support.
- 1111  Shareability ignored.

All other values are reserved.

In ARMv8-A the permitted values are 0000, 0001, and 1111.

PMSA, bits [7:4]
Indicates support for a PMSA. Defined values are:

- 0000  Not supported.
- 0001  Support for IMPLEMENTATION DEFINED PMSA.
- 0010  Support for VMSAv6, with a Cache Type Register implemented.
- 0011  Support for VMSAv7, with support for memory subsections. ARMv7-R profile.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

VMSA, bits [3:0]
Indicates support for a VMSA. Defined values are:

- 0000  Not supported.
- 0001  Support for IMPLEMENTATION DEFINED VMSA.
- 0010  Support for VMSAv6, with Cache and TLB Type Registers implemented.
- 0011  Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile.
- 0100  As for 0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
- 0101  As for 0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In ARMv8-A the only permitted value is 0101.

Accessing the ID_MMFR0:

To access the ID_MMFR0:

MRC p15,0,<Rt>,c0,c1,4 ; Read ID_MMFR0 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0001</td>
<td>100</td>
</tr>
</tbody>
</table>
G6.2.85  ID_MMFR1, Memory Model Feature Register 1

The ID_MMFR1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_MMFR0, ID_MMFR2, and ID_MMFR3.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_MMFR1 is architecturally mapped to AArch64 System register ID_MMFR1_EL1.

Attributes

ID_MMFR1 is a 32-bit register.

Field descriptions

The ID_MMFR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>

<td>L1UniVA</td>
<td>L1HvdVA</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

0000  No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0001 Branch predictor requires flushing on:
  • Enabling or disabling the MMU.
  • Writing new data to instruction locations.
  • Writing new mappings to the translation tables.
  • Any change to the TTBR0, TTBR1, or TTBCR registers.
  • Changes of FCSE ProcessID or ContextID.

0010 Branch predictor requires flushing on:
  • Enabling or disabling the MMU.
  • Writing new data to instruction locations.
  • Writing new mappings to the translation tables.
  • Any change to the TTBR0, TTBR1, or TTBCR registers without a corresponding change to the FCSE ProcessID or ContextID.

0011 Branch predictor requires flushing only on writing new data to instruction locations.

0100 For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In ARMv8-A the only permitted value is 0100.

The branch predictor is described in some documentation as the Branch Target Buffer.

**L1TstCl, bits [27:24]**
Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

0000 None supported.

0001 Supported Level 1 data cache test and clean operations are:
  • Test and clean data cache.

0010 As for 0001, and adds:
  • Test, clean, and invalidate data cache.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**L1Uni, bits [23:20]**
Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations, for a unified cache implementation. Defined values are:

0000 None supported.

0001 Supported entire Level 1 cache operations are:
  • Invalidate cache, including branch predictor if appropriate.
  • Invalidate branch predictor, if appropriate.

0010 As for 0001, and adds:
  • Clean cache, using a recursive model that uses the cache dirty status bit.
  • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**L1Hvd, bits [19:16]**
Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations, for a Harvard cache implementation. Defined values are:

0000 None supported.
Supported entire Level 1 cache operations are:
- Invalidate instruction cache, including branch predictor if appropriate.
- Invalidate branch predictor, if appropriate.

As for 0001, and adds:
- Invalidate data cache.
- Invalidate data cache and instruction cache, including branch predictor if appropriate.

As for 0010, and adds:
- Clean data cache, using a recursive model that uses the cache dirty status bit.
- Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1UniSW, bits [15:12]
Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:
0000 None supported.
0001 Supported Level 1 unified cache line maintenance operations by set/way are:
  - Clean cache line by set/way.
0010 As for 0001, and adds:
  - Clean and invalidate cache line by set/way.
0011 As for 0010, and adds:
  - Invalidate cache line by set/way.
All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1HvdSW, bits [11:8]
Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:
0000 None supported.
0001 Supported Level 1 Harvard cache line maintenance operations by set/way are:
  - Clean data cache line by set/way.
  - Clean and invalidate data cache line by set/way.
0010 As for 0001, and adds:
  - Invalidate data cache line by set/way.
0011 As for 0010, and adds:
  - Invalidate instruction cache line by set/way.
All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1UniVA, bits [7:4]
Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:
0000 None supported.
0001 Supported Level 1 unified cache line maintenance operations by VA are:
  - Clean cache line by VA.
• Invalidate cache line by VA.
• Clean and invalidate cache line by VA.

0010  As for 0001, and adds:
• Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1HvdVA, bits [3:0]
Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

0000  None supported.
0001  Supported Level 1 Harvard cache line maintenance operations by VA are:
• Clean data cache line by VA.
• Invalidate data cache line by VA.
• Clean and invalidate data cache line by VA.
• Clean instruction cache line by VA.

0010  As for 0001, and adds:
• Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

Accessing the ID_MMFR1:

To access the ID_MMFR1:

MRC p15,0,<Rt>,c0,c1,5 ; Read ID_MMFR1 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>

<td>101</td>
</tr>
</tbody>
</table>
G6.2.86  ID_MMMFR2, Memory Model Feature Register 2

The ID_MMMFR2 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_MMMFR0, ID_MMMFR1, and ID_MMMFR3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_MMMFR2 is architecturally mapped to AArch64 System register ID_MMMFR2_EL1.

**Attributes**

ID_MMMFR2 is a 32-bit register.

**Field descriptions**

The ID_MMMFR2 bit assignments are:

```
 31 28 27 24 23 20 19 16 15 12 11  8  7  4  3  0
| HWAccFlg | WFIStall | MemBarr | UniTLB | HvdTLB | L1HvdRng | L1HvdBG | L1HvdFG |
```
HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the ARM Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

- 0000  Not supported.
- 0001  Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

- 0000  Not supported.
- 0001  Support for WFI stalling.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported CP15 memory barrier operations:

- 0000  None supported.
- 0001  Supported CP15 Memory barrier operations are:
  - Data Synchronization Barrier (DSB), which in previous versions of the ARM architecture was named Data Write Barrier (DWB).
- 0010  As for 0001, and adds:
  - Instruction Synchronization Barrier (ISB), which in previous versions of the ARM architecture was called Prefetch Flush.
  - Data Memory Barrier (DMB).

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

ARM deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

- 0000  Not supported.
- 0001  Supported unified TLB maintenance operations are:
  - Invalidate all entries in the TLB.
  - Invalidate TLB entry by VA.
- 0010  As for 0001, and adds:
  - Invalidate TLB entries by ASID match.
- 0011  As for 0010, and adds:
  - Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.
- 0100  As for 0011, and adds:
  - Invalidate Hyp mode unified TLB entry by VA.
  - Invalidate entire Non-secure PL1&0 unified TLB.
  - Invalidate entire Hyp mode unified TLB.
0101  As for 0100, and adds the following operations: TLBIMVALID, TLBIMVAALID, TLBIMVALIDH, TLBIMVAAL, TLBIMVAALH.

0110  As for 0110, and adds the following operations: TLBIIPAS2I, TLBIIPAS2LIS, TLBIIPAS2, TLBIIPAS2L.

All other values are reserved.

In ARMv8-A the only permitted value is 0110.

HvdTLB, bits [15:12]
If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. ARM deprecates the use of this field by software.

L1HvdRng, bits [11:8]
Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:
0000  Not supported.
0001  Supported Level 1 Harvard cache maintenance range operations are:
  •  Invalidate data cache range by VA.
  •  Invalidate instruction cache range by VA.
  •  Clean data cache range by VA.
  •  Clean and invalidate data cache range by VA.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1HvdBG, bits [7:4]
Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:
0000  Not supported.
0001  Supported Level 1 Harvard cache background fetch operations are:
  •  Fetch instruction cache range by VA.
  •  Fetch data cache range by VA.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

L1HvdFG, bits [3:0]
Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:
0000  Not supported.
0001  Supported Level 1 Harvard cache foreground fetch operations are:
  •  Fetch instruction cache range by VA.
  •  Fetch data cache range by VA.

All other values are reserved.
In ARMv8-A the only permitted value is 0000.

### ID_MMFR3, Memory Model Feature Register 3

The ID_MMFR3 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>

<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_MMFR0, ID_MMFR1, and ID_MMFR2.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states. AArch32 System register ID_MMFR3 is architecturally mapped to AArch64 System register ID_MMFR3_EL1.

**Attributes**

ID_MMFR3 is a 32-bit register.

**Field descriptions**

The ID_MMFR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Supersec</td>

</tbody>
</table>
Supersec, bits [31:28]
Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

- 0000: Supersections supported.
- 1111: Supersections not supported.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 1111.

CMemSz, bits [27:24]
Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

- 0000: 4GB, corresponding to a 32-bit physical address range.
- 0001: 64GB, corresponding to a 36-bit physical address range.
- 0010: 1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.
In ARMv8-A the permitted values are 0000, 0001 and 0010.

CohWalk, bits [23:20]
Coherent Walk. Indicates whether Translation table updates require a clean to the point of unification. Defined values are:

- 0000: Updates to the translation tables require a clean to the point of unification to ensure visibility by subsequent translation table walks.
- 0001: Updates to the translation tables do not require a clean to the point of unification to ensure visibility by subsequent translation table walks.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

Bits [19:16]
Reserved, RES0.

MaintBest, bits [15:12]
Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

- 0000: Cache, TLB, and branch predictor operations only affect local structures.
- 0001: Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
- 0010: Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.
In ARMv8-A the only permitted value is 0010.

BPMaint, bits [11:8]
Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

- 0000: None supported.
- 0001: Supported branch predictor maintenance operations are:
  • Invalidate all branch predictors.
- 0010: As for 0001, and adds:
  • Invalidate branch predictors by VA.

All other values are reserved.
In ARMv8-A the only permitted value is 0010.

**CMaintSW, bits [7:4]**

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

- **0000**: None supported.
- **0001**: Supported hierarchical cache maintenance operations by set/way are:
  - Invalidate data cache by set/way.
  - Clean data cache by set/way.
  - Clean and invalidate data cache by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, the data cache operations apply to the unified caches.

**CMaintVA, bits [3:0]**

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

- **0000**: None supported.
- **0001**: Supported hierarchical cache maintenance operations by VA are:
  - Invalidate data cache by VA.
  - Clean data cache by VA.
  - Clean and invalidate data cache by VA.
  - Invalidate instruction cache by VA.
  - Invalidate all instruction cache entries.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, the data cache operations apply to the unified caches, and the instruction cache operations are not implemented.

**Accessing the ID_MMF3R:**

To access the ID_MMF3R:

```
MRC p15,0,<Rt>,c0,c1,7 ; Read ID_MMF3R into Rt
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0001</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.2.88  ID_MMFR4, Memory Model Feature Register 4

The ID_MMFR4 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_MMFR4 is architecturally mapped to AArch64 System register ID_MMFR4_EL1.

**Attributes**

ID_MMFR4 is a 32-bit register.

**Field descriptions**

The ID_MMFR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:0</td>
<td>RAZ/WI</td>
</tr>
</tbody>
</table>

**AC2, bits [7:4]**

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2.

- **0000**: ACTLR2 and HACTLR2 are not supported.
- **0001**: ACTLR2 and HACTLR2 are implemented.
All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.

**Accessing the ID_MMFR4:**

To access the ID_MMFR4:

```
MRC p15, 0, <Rt>, c0, c2, 6 ; Read ID_MMFR4 into Rt
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>110</td>
</tr>
</tbody>
</table>
G6.2.89 ID_PFR0, Processor Feature Register 0

The ID_PFR0 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_PFR1.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_PFR0 is architecturally mapped to AArch64 System register ID_PFR0_EL1.

Attributes

ID_PFR0 is a 32-bit register.

Field descriptions

The ID_PFR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>State3</td>
<td>State2</td>
<td>State1</td>
<td>State0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:16]

Reserved, RES0.
State3, bits [15:12]

T32EE instruction set support. Defined values are:

- **0000** Not implemented.
- **0001** T32EE instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is **0000**.

State2, bits [11:8]

Jazelle extension support. Defined values are:

- **0000** Not implemented.
- **0001** Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
- **0010** Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In ARMv8-A the only permitted value is **0000**.

State1, bits [7:4]

T32 instruction set support. Defined values are:

- **0000** T32 instruction set not implemented.
- **0001** T32 encodings before the introduction of Thumb-2 technology implemented:
  - All instructions are 16-bit.
  - A BL or BLX is a pair of 16-bit instructions.
  - 32-bit instructions other than BL and BLX cannot be encoded.
- **0011** T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In ARMv8-A the only permitted value is **0011**.

State0, bits [3:0]

A32 instruction set support. Defined values are:

- **0000** A32 instruction set not implemented.
- **0001** A32 instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is **0001**.

**Accessing the ID_PFR0:**

To access the ID_PFR0:

```
MRC p15,0,<Rt>,c0,c1,0 ; Read ID_PFR0 into Rt
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>
**G6.2.90 ID_PFR1, Processor Feature Register 1**

The ID_PFR1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Must be interpreted with ID_PFR0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID_PFR1 is architecturally mapped to AArch64 System register ID_PFR1_EL1.

**Attributes**

ID_PFR1 is a 32-bit register.

**Field descriptions**

The ID_PFR1 bit assignments are:

- **GIC**
- **Virt_frac**
- **Sec_frac**
- **GenTimer**
- **MProgMod**
- **Security**
- **ProgMod**

Virtualization
GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

0000  No System register interface to the GIC CPU interface is supported.
0001  System register interface to the GIC CPU interface is supported.

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

0000  No features from the ARMv7 Virtualization Extensions are implemented.
0001  The following features of the ARMv7 Virtualization Extensions are implemented:

•  The SCR.SIF bit, if EL3 is implemented.
•  The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.
•  The MSR (Banked register) and MRS (Banked register) instructions.
•  The ERET instruction.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

0000  No features from the ARMv7 Security Extensions are implemented.
0001  The following features from the ARMv7 Security Extensions are implemented:

•  The VBAR register.
•  The TTBCR.PD0 and TTBCR.PD1 bits.
0010  As for 0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000, 0001, and 0010.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

0000  Not implemented.
0001  Generic Timer implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

0000  EL2, Hyp mode, and the HVC instruction not implemented.
0001  EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0001 implemented.

All other values are reserved.
In ARMv8-A the permitted values are 0000 and 0001.

**Note**

The ID_ISARs do not identify whether the HVC instruction is implemented.

**MProgMod, bits [11:8]**

M profile programmers' model support. Defined values are:

- 0000 Not supported.
- 0010 Support for two-stack programmers' model.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

**Security, bits [7:4]**

Security support. Defined values are:

- 0000 EL3, Monitor mode, and the SMC instruction not implemented.
- 0001 EL3, Monitor mode, the SMC instruction, and all the features described by Secfrac == 0001 implemented.
- 0010 As for 0001, and adds the ability to set the NSACR.RFR bit. Not permitted in ARMv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

**ProgMod, bits [3:0]**

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

- 0000 Not supported.
- 0001 Supported.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**Accessing the ID_PFR1:**

To access the ID_PFR1:

```
MRC p15,0,<Rt>,c0,c1,1 ; Read ID_PFR1 into Rt
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0001</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.91  IFAR, Instruction Fault Address Register

The IFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

IFAR(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

IFAR(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

IFAR is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.
- If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TRVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.
- If HSTR.T6==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T6==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register IFAR(NS) is architecturally mapped to AArch64 System register FAR_EL1[63:32].

AArch32 System register IFAR(S) is architecturally mapped to AArch32 System register HIFAR when EL2 is implemented.

AArch32 System register IFAR(S) is architecturally mapped to AArch64 System register FAR_EL2[63:32] when EL2 is implemented.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.
Attributes
IFAR is a 32-bit register.

Field descriptions
The IFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:0]</td>
<td>VA of faulting address of synchronous Prefetch Abort exception</td>
</tr>
</tbody>
</table>

Accessing the IFAR:

To access the IFAR:

- MRC p15,0,<Rt>,c6,c0,2 ; Read IFAR into Rt
- MCR p15,0,<Rt>,c6,c0,2 ; Write Rt to IFAR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0110</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.92   IFSR, Instruction Fault Status Register

The IFSR characteristics are:

**Purpose**

Holds status information about the last instruction fault.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

IFSR(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

IFSR(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

IFSR is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.
If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
If HCR_EL2.TRVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.
If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.
If HISTR.T5==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
If HISTR_EL2.T5==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register IFSR is architecturally mapped to AArch64 System register IFSR32_EL2.

The current translation table format determines which format of the register is used.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

IFSR is a 32-bit register.
Field descriptions

The IFSR bit assignments are:

When TTBCR.EAE==0:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-17</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>16</td>
<td>FnV, FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.</td>
</tr>
<tr>
<td></td>
<td>0 IFAR is valid.</td>
</tr>
<tr>
<td></td>
<td>1 IFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
<tr>
<td>15-13</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>12</td>
<td>ExT, External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.</td>
</tr>
<tr>
<td>11</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>10</td>
<td>FS[3:0], Fault status bits. Interpreted with bit [10]. Possible values of FS[4:0] are:</td>
</tr>
<tr>
<td>9</td>
<td>LPAE, On taking a Data Abort exception, this bit is set as follows:</td>
</tr>
<tr>
<td></td>
<td>0 Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td></td>
<td>1 Using the Long-descriptor translation table formats.</td>
</tr>
<tr>
<td>8-4</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>3-0</td>
<td>FS[3:0], bits [3:0]</td>
</tr>
</tbody>
</table>

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.
When TTBCR.EAE==1:

<table>
<thead>
<tr>
<th></th>

</tbody>
</table>

Reserved, RES0.

Far not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

0 IFAR is valid.
1 IFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

Reserved, RES0.

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

For aborts other than external aborts this bit always returns 0.
Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

0  Using the Short-descriptor translation table formats.
1  Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

000000  Address size fault in TTBR0 or TTBR1
000001  Address size fault, first level
000010  Address size fault, second level
000011  Address size fault, third level
000101  Translation fault, first level
000110  Translation fault, second level
000111  Translation fault, third level
001001  Access flag fault, first level
001010  Access flag fault, second level
001011  Access flag fault, third level
001101  Permission fault, first level
001110  Permission fault, second level
001111  Permission fault, third level
010000  Synchronous external abort
010101  Synchronous external abort on translation table walk, first level
010110  Synchronous external abort on translation table walk, second level
010111  Synchronous external abort on translation table walk, third level
011000  Synchronous parity or ECC error on memory access
011101  Synchronous parity or ECC error on memory access on translation table walk, first level
011110  Synchronous parity or ECC error on memory access on translation table walk, second level
011111  Synchronous parity or ECC error on memory access on translation table walk, third level
100001  Alignment fault
100010  Debug event
110000  TLB conflict abort

All other values are reserved.

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
• For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because an MMU is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a First level fault.

• For an Access flag fault, the lookup level of the translation table that gave the fault.

• For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

Accessing the IFSR:

To access the IFSR:

MRC p15,0,<Rt>,c5,c0,1 ; Read IFSR into Rt
MCR p15,0,<Rt>,c5,c0,1 ; Write Rt to IFSR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>010</td>
<td>000</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.93 **ISR, Interrupt Status Register**

The ISR characteristics are:

**Purpose**

Shows whether an IRQ, FIQ, or external abort is pending. If EL2 is implemented, an indicated pending abort might be a physical abort or a virtual abort.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845](#) for exceptions taken to AArch32 state, and [Synchronous exception prioritization on page D1-1546](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ISR is architecturally mapped to AArch64 System register ISR_EL1.

**Attributes**

ISR is a 32-bit register.

**Field descriptions**

The ISR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>A</td>
<td>I</td>
<td>F</td>
<td>RES0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:9]**

Reserved, RES0.

**A, bit [8]**

External abort pending bit:

- 0: No pending external abort.
- 1: An external abort is pending.
I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:
0          No pending IRQ.
1          An IRQ interrupt is pending.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.
0          No pending FIQ.
1          An FIQ interrupt is pending.

Bits [5:0]

Reserved, RES0.

Accessing the ISR:

To access the ISR:

MRC p15,0,<Rt>,c12,c1,0 ; Read ISR into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.94 ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

Purpose

Invalidate all instruction TLB entries for the PL1&0 translation regime, subject to the Privilege level and Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIALL on page G4-4144.

Usage constraints

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

Configurations

There are no configuration notes.

Attributes

ITLBIALL is a 32-bit system operation.

Field descriptions

The ITLBIALL operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

Performing the ITLBIALL operation:

To perform the ITLBIALL operation:

MCR p15,0,<Rt>,c8,c5,0 ; ITLBIALL operation, ignoring the value in Rt
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0101</td>
<td>000</td>
</tr>
</tbody>
</table>
**G6.2.95 ITLBIASID, Instruction TLB Invalidate by ASID match**

The ITLBIASID characteristics are:

**Purpose**

Invalidate instruction TLB entries for stage 1 of the PL1&0 translation regime that match the given ASID, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see [TLBIASID on page G4-4144](#).

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845](#) for exceptions taken to AArch32 state, and [Synchronous exception prioritization on page D1-1546](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

ITLBIASID is a 32-bit system operation.

**Field descriptions**

The ITLBIASID input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ASID</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.
ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

Performing the ITLBIASID operation:

To perform the ITLBIASID operation:

MCR p15, 0, <Rt>, c8, c5, 2 ; ITLBIASID operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0101</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.96 ITLBIMVA, Instruction TLB Invalidate by VA

The ITLBIMVA characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime stage 1 that match the given VA and ASID, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVA on page G4-4144.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

ITLBIMVA is a 32-bit system operation.

**Field descriptions**

The ITLBIMVA input value bit assignments are:

```
+---+---+---+---+---+
| 31| 24| 12| 11|  0|
+---+---+---+---+---+
| VA| RES0| ASID |
+---+---+---+---+---+
VA, bits [31:12]
Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]
Reserved, RES0.

ASID, bits [7:0]
ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.
Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Performing the ITLBIMVA operation:
To perform the ITLBIMVA operation:
MCR p15,0,<Rt>,c8,c5,1 ; ITLBIMVA operation
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0101</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.97 JIDR, Jazelle ID Register

The JIDR characteristics are:

**Purpose**

A Jazelle register, which identified the Jazelle architecture version.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP DEF</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

For EL0 using AArch32, it is IMPLEMENTATION DEFINED whether JIDR is RAZ or UNDEFINED.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TID0==1, Non-secure PL0 and PL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID0==1, Non-secure PL0 and PL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

JIDR is a 32-bit register.

**Field descriptions**

The JIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RAZ</td>
</tr>
</tbody>
</table>

Bits [31:0]  
Reserved, RAZ.

**Accessing the JIDR:**

To access the JIDR:

MRC p14,7,<Rt>,c0,c0,0 ; Read JIDR into Rt
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>111</td>
<td>0000</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.98 JMC R, Jazelle Main Configuration Register

The JMCR characteristics are:

Purpose

A Jazelle register, which provides control of the Jazelle extension.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP DEF</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

For EL0 using AArch32, it is IMPLEMENTATION DEFINED whether JMCR is RAZ/WI or UNDEFINED.

Traps and Enables

There are no traps or enables affecting this register.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

Attributes

JMCR is a 32-bit register.

Field descriptions

The JMCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RAZ/WI |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Bits [31:0]

Reserved, RAZ/WI.

Accessing the JMCR:

To access the JMCR:

MRC p14,7,<Rt>,c2,c0,0 ; Read JMCR into Rt
MCR p14,7,<Rt>,c2,c0,0 ; Write Rt to JMCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>111</td>
<td>0010</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.99 JOSCR, Jazelle OS Control Register

The JOSCR characteristics are:

Purpose
A Jazelle register, which provides operating system control of the Jazelle Extension.

Usage constraints
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP DEF</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

For EL0 using AArch32, it is implementation defined whether JOSCR is RAZ/WI or UNDEFINED.

Traps and Enables
There are no traps or enables affecting this register.

Configurations
There is one instance of this register that is used in both Secure and Non-secure states.

Attributes
JOSCR is a 32-bit register.

Field descriptions
The JOSCR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RAZ/WI</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:0]
Reserved, RAZ/WI.

Accessing the JOSCR:
To access the JOSCR:

MRC p14,7,<Rt>,c1,c0,0 ; Read JOSCR into Rt
MCR p14,7,<Rt>,c1,c0,0 ; Write Rt to JOSCR
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>111</td>
<td>0001</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.100 MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

**Purpose**

Along with MAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

MAIR0(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

MAIR0(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

MAIR0 is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Only accessible when TTBCR.EAE==1. When TTBCR.EAE==0, the PRRR is accessed.

AttrIndx[2], from the translation table descriptor, selects the appropriate MAIR: setting AttrIndx[2] to 0 selects MAIR0.

In an implementation that includes EL3:

- MAIR0(S) gives the value for memory accesses from Secure state.
- MAIR0(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.
If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
If HCR_EL2.TRVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.
If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.
If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.
Configurations
AArch32 System register MAIR0 is architecturally mapped to AArch64 System register MAIR_EL1[31:0] when TTBCR.EAE==1.
When EL3 is using AArch32, write access to MAIR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.
RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes
MAIR0 is a 32-bit register.

Field descriptions
The MAIR0 bit assignments are:

When TTBCR.EAE==1:

<table>
<thead>
<tr>
<th>31</th>
<th>24 23</th>
<th>16 15</th>
<th>8 7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attr3</td>
<td>Attr2</td>
<td>Attr1</td>
<td>Attr0</td>
<td></td>
</tr>
</tbody>
</table>

Attr<n>, bits [8n+7:8n], for n = 0 to 3
The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

• AttrIndx[2:0] gives the value of <n> in Attr<n>.
• AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>00RW, RW not 00</td>
<td>Normal Memory, Outer Write-through transient</td>
</tr>
<tr>
<td>0100</td>
<td>Normal Memory, Outer Non-Cacheable</td>
</tr>
<tr>
<td>01RW, RW not 00</td>
<td>Normal Memory, Outer Write-back transient</td>
</tr>
<tr>
<td>10RW</td>
<td>Normal Memory, Outer Write-through non-transient</td>
</tr>
<tr>
<td>11RW</td>
<td>Normal Memory, Outer Write-back non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read Allocate Policy, W = Outer Write Allocate Policy. The meaning of bits [3:0] depends on the value of bits [7:4]:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[3:0]</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is 0000</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is not 0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device-nGnRnE memory</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>00RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal Memory, Inner Write-through transient</td>
</tr>
<tr>
<td>0100</td>
<td>Device-nGnRE memory</td>
<td>Normal memory, Inner Non-Cacheable</td>
</tr>
<tr>
<td>01RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal Memory, Inner Write-back transient</td>
</tr>
</tbody>
</table>
R = Inner Read Allocate Policy, W = Inner Write Allocate Policy.
The R and W bits in some Attr<n> fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Do not allocate</td>
</tr>
<tr>
<td>1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

### Accessing the MAIR0:

To access the MAIR0 when TTBCR.EAE==1:

MRC p15,0,<Rt>,c10,c2,0 ; Read MAIR0 into Rt
MCR p15,0,<Rt>,c10,c2,0 ; Write Rt to MAIR0

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1010</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.101 MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

**Purpose**

Along with MAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

MAIR1(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

MAIR1(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

MAIR1 is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Only accessible when TTBCR.EAE==1. When TTBCR.EAE==0, the NMRR is accessed.

AttrIndx[2], from the translation table descriptor, selects the appropriate MAIR: setting AttrIndx[2] to 1 selects MAIR1.

In an implementation that includes EL3:

- MAIR1(S) gives the value for memory accesses from Secure state.
- MAIR1(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.
- If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TRVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.
- If HSTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.
Configurations

AArch32 System register MAIR1 is architecturally mapped to AArch64 System register MAIR_EL1[63:32] when TTBCR.EAE==1.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

MAIR1 is a 32-bit register.

Field descriptions

The MAIR1 bit assignments are:

*When TTBCR.EAE==1:*

<table>
<thead>
<tr>
<th>31</th>
<th>24 23</th>
<th>16 15</th>
<th>8 7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attr7</td>
<td>Attr6</td>
<td>Attr5</td>
<td>Attr4</td>
<td></td>
</tr>
</tbody>
</table>

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>00RW, RW not 00</td>
<td>Normal Memory, Outer Write-through transient</td>
</tr>
<tr>
<td>0100</td>
<td>Normal Memory, Outer Non-Cacheable</td>
</tr>
<tr>
<td>01RW, RW not 00</td>
<td>Normal Memory, Outer Write-back transient</td>
</tr>
<tr>
<td>10RW</td>
<td>Normal Memory, Outer Write-through non-transient</td>
</tr>
<tr>
<td>11RW</td>
<td>Normal Memory, Outer Write-back non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read Allocate Policy, W = Outer Write Allocate Policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[3:0]</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is 0000</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is not 0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Device-nGnRnE memory</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>00RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal Memory, Inner Write-through transient</td>
</tr>
<tr>
<td>0100</td>
<td>Device-nGnRE memory</td>
<td>Normal memory, Inner Non-Cacheable</td>
</tr>
<tr>
<td>01RW, RW not 00</td>
<td>UNPREDICTABLE</td>
<td>Normal Memory, Inner Write-back transient</td>
</tr>
</tbody>
</table>
### Attr<\(n\)[3:0] | Meaning when Attr<\(n\)[7:4] is 0000 | Meaning when Attr<\(n\)[7:4] is not 0000
---|---|---
1000 | Device-nGRE memory | Normal Memory, Inner Write-through non-transient (RW=00)
10RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-through non-transient
1100 | Device-GRE memory | Normal Memory, Inner Write-back non-transient (RW=00)
11RW, RW not 00 | UNPREDICTABLE | Normal Memory, Inner Write-back non-transient

R = Inner Read Allocate Policy, W = Inner Write Allocate Policy.
The R and W bits in some Attr<\(n\)> fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Do not allocate</td>
</tr>
<tr>
<td>1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

### Accessing the MAIR1:

To access the MAIR1 when TTBCR.EAE==1:

\[
\text{MRC p15,0,<Rt>,c10,c2,1 ; Read MAIR1 into Rt}
\]
\[
\text{MCR p15,0,<Rt>,c10,c2,1 ; Write Rt to MAIR1}
\]

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1010</td>
<td>0010</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.102 MIDR, Main ID Register

The MIDR characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MIDR is architecturally mapped to AArch64 System register MIDR_EL1.

AArch32 System register MIDR is architecturally mapped to External register MIDR_EL1.

Some fields of the MIDR are IMPLEMENTATION DEFINED. For details of the values of these fields for a particular ARMv8 implementation, and any implementation-specific significance of these values, see the product documentation.

**Attributes**

MIDR is a 32-bit register.

**Field descriptions**

The MIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementer</td>
<td>Variant</td>
<td></td>
<td></td>
<td>PartNum</td>
<td></td>
<td></td>
<td>Revision</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Architecture
Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td>ARM Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>B</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>C</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>D</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x49</td>
<td>I</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x4D</td>
<td>M</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>N</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>P</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Q</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>V</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>i</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

Architecture, bits [19:16]

The permitted values of this field are:

- 0001 ARMv4
- 0010 ARMv4T
- 0011 ARMv5 (obsolete)
- 0100 ARMv5T
- 0101 ARMv5TE
- 0110 ARMv5TEJ
- 0111 ARMv6
- 1111 Architectural features are individually identified in the ID_* registers, see Identification registers, functional group on page G4-4232.

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.
Accessing the MIDR:

To access the MIDR:

MRC p15,0,<Rt>,c0,c0,0 ; Read MIDR into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.103 MPIDR, Multiprocessor Affinity Register

The MPIDR characteristics are:

**Purpose**

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

1. If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
2. If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MPIDR is architecturally mapped to AArch64 System register MPIDR_EL1.

The assigned value of the MPIDR.\{Aff2, Aff1, Aff0\} or MPIDR_EL1.\{Aff3, Aff2, Aff1, Aff0\} set of fields of each PE must be unique within the system as a whole.

In a uniprocessor system ARM recommends that each Aff<n> field of this register returns a value of 0.

**Attributes**

MPIDR is a 32-bit register.

**Field descriptions**

The MPIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>16</th>
<th>15</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>M</td>
<td>U</td>
<td>RES0</td>
<td>Aff2</td>
<td>Aff1</td>
<td>Aff0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**MT**
M, bit [31]
Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:
0 This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
1 This implementation includes the ARMv7 Multiprocessing Extensions functionality.
In ARMv8 this bit is RES1.

U, bit [30]
Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:
0 Processor is part of a multiprocessor system.
1 Processor is part of a uniprocessor system.

Bits [29:25]
Reserved, RES0.

MT, bit [24]
Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach. The possible values of this bit are:
0 Performance of PEs at the lowest affinity level is largely independent.
1 Performance of PEs at the lowest affinity level is very interdependent.

Aff2, bits [23:16]
Affinity level 2. The least significant affinity level field, for this PE in the system.

Aff1, bits [15:8]
Affinity level 1. The intermediate affinity level field, for this PE in the system.

Aff0, bits [7:0]
Affinity level 0. The most significant affinity level field, for this PE in the system.

Accessing the MPIDR:
To access the MPIDR:

MRC p15,0,<Rt>,c0,c0,5 ; Read MPIDR into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0000</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.2.104 MVBAR, Monitor Vector Base Address Register

The MVBAR characteristics are:

**Purpose**

Holds the vector base address for any exception that is taken to Monitor mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Secure software must program the MVBAR with the required initial value as part of the PE boot sequence.

If EL3 is implemented and is using AArch64, any read or write to MVBAR in Secure EL1 state in AArch32 is trapped as an exception to EL3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

It is IMPLEMENTATION DEFINED whether MVBAR[0] has a fixed value and ignored writes, or takes the last value written to it.

When EL3 is using AArch32, write access to MVBAR(S) is disabled when the CP15DISABLE signal is asserted HIGH.

On a reset into EL3 using AArch32, the reset value of MVBAR is an IMPLEMENTATION DEFINED choice between:

- MVBAR[31:5] = an IMPLEMENTATION DEFINED value, which might be UNKNOWN.
- MVBAR[4:1] = RES0.
- MVBAR[0] = 0.

And:

- MVBAR[31:1] = an IMPLEMENTATION DEFINED value that is bits[31:1] of the AArch32 reset address.
- MVBAR[0] = 1.

**Attributes**

MVBAR is a 32-bit register.
Field descriptions

The MVBAR bit assignments are:

When programmed with a vector base address:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:5]</td>
<td>Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.</td>
</tr>
<tr>
<td>Reserved, bits [4:0]</td>
<td>Reserved, see Configurations.</td>
</tr>
</tbody>
</table>

Accessing the MVBAR:

To access the MVBAR:

MRC p15,0,<Rt>,c12,c0,1 ; Read MVBAR into Rt
MCR p15,0,<Rt>,c12,c0,1 ; Write Rt to MVBAR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.105 MVFR0, Media and VFP Feature Register 0

The MVFR0 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Config-RO</td>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Config-RO</td>
<td>Config-RO</td>
</tr>
</tbody>
</table>

Must be interpreted with MVFR1 and MVFR2.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If CPTR_EL2.TFP==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If CPTR_EL3.TFP==1, PL1 and PL2 read accesses to this register are trapped to EL3.
- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If CPACR.cp<n>==00, PL1 read accesses to this register are UNDEFINED.
- If CPACR.cp<n>==10, Reserved.
- If CPACR.cp<n>==11, Full access.
- If NSACR.cp<n>==0, Non-secure PL1 and PL2 read accesses to this register are UNDEFINED.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MVFR0 is architecturally mapped to AArch64 System register MVFR0_EL1.

Implemented only if the implementation includes floating-point and Advanced SIMD instructions.

Attributes

MVFR0 is a 32-bit register.

Field descriptions

The MVFR0 bit assignments are:
FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates the rounding modes supported by the VFP floating-point hardware. Defined values are:

0000  Only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.
0001  All rounding modes supported.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.

FPShVec, bits [27:24]

Short Vectors. Indicates the hardware support for ARMv6 VFP short vectors. Defined values are:

0000  Short vectors not supported.
0001  Short vector operation supported.
All other values are reserved.
In ARMv8-A the only permitted value is 0000.

FPSqrt, bits [23:20]

Square Root. Indicates the hardware support for the ARMv6 VFP square root operations. Defined values are:

0000  Not supported in hardware.
0001  Supported.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.
The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates the hardware support for VFP divide operations. Defined values are:

0000  Not supported in hardware.
0001  Supported.
All other values are reserved.
In ARMv8-A the only permitted value is 0001.
The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the VFP hardware implementation supports exception trapping. Defined values are:

0000  Not supported.
0001  Supported by the hardware. When exception trapping is supported, support code is needed to handle the trapped exceptions.
All other values are reserved.
A value of 0001 does not indicate that trapped exception handling is available. Because trapped exception handling requires support code, only the support code can provide this information.

**FPDP, bits [11:8]**

Double Precision. Indicates the hardware support for VFP double-precision operations. Defined values are:

0000  Not supported in hardware.
0001  Supported, VFPv2.
0010  Supported, VFPv3, VFPv4, or ARMv8. VFPv3 and ARMv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0001.
- VDIV.F64 is only available if the Divide field is 0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

**FPSP, bits [7:4]**

Single Precision. Indicates the hardware support for VFP single-precision operations. Defined values are:

0000  Not supported in hardware.
0001  Supported, VFPv2.
0010  Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0001.
- VDIV.F32 is only available if the Divide field is 0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

**SIMDReg, bits [3:0]**

Advanced SIMD registers. Indicates support for the Advanced SIMD register bank. Defined values are:

0000  Not supported.
0001  Supported, 16 x 64-bit registers.
0010  Supported, 32 x 64-bit registers.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

If this field is nonzero:

- All VFP LDC, STC, MCR, and MRC instructions are supported.
- If the MCRR and MRRC instructions are supported then the corresponding VFP instructions are supported.
Accessing the MVFR0:

To access the MVFR0:

VMRS <Rt>, MVFR0 ; Read MVFR0 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>spec_reg</th>
</tr>
</thead>
<tbody>
<tr>
<td>0111</td>
</tr>
</tbody>
</table>
G6.2.106 MVFR1, Media and VFP Feature Register 1

The MVFR1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td></td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>Config-RO</td>
<td>Config-RO</td>
</tr>
</tbody>
</table>

Must be interpreted with MVFR0 and MVFR2.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see **Synchronous exception prioritization for exceptions taken to AArch32 state** on page G1-3845 for exceptions taken to AArch32 state, and **Synchronous exception prioritization on page D1-1546** for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If CPTR_EL2.TFP==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If CPTR_EL3.TFP==1, PL1 and PL2 read accesses to this register are trapped to EL3.
- If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If CPACR.cp<n>=00, PL1 read accesses to this register are UNDEFINED.
- If CPACR.cp<n>=10, Reserved.
- If CPACR.cp<n>=11, Full access.
- If NSACR.cp<n>=0, Non-secure PL1 and PL2 read accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states. AArch32 System register MVFR1 is architecturally mapped to AArch64 System register MVFR1_EL1. Implemented only if the implementation includes floating-point and Advanced SIMD instructions.

**Attributes**

MVFR1 is a 32-bit register.

**Field descriptions**

The MVFR1 bit assignments are:
SIMDFMAC, bits [31:28]
Advanced SIMD Fused Multiply-Accumulate. Indicates whether the floating-point and Advanced SIMD implementation includes the fused multiply accumulate instructions. Defined values are:

- 0000 Not implemented.
- 0001 Implemented.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.
The floating-point and Advanced SIMD implementations must provide the same level of support for these instructions.

FPHP, bits [27:24]
Floating Point Half Precision. Indicates whether the floating-point implementation provides half-precision floating-point conversion instructions. Defined values are:

- 0000 Not implemented.
- 0001 Instructions to convert between half-precision and single-precision implemented.
- 0010 As for 0b0001, and also instructions to convert between half-precision and double-precision implemented.

All other values are reserved.
In ARMv8-A the only permitted value is 0010.

SIMDHP, bits [23:20]
Advanced SIMD Half Precision. Indicates whether the floating-point and Advanced SIMD implementation provides half-precision floating-point conversion instructions. Defined values are:

- 0000 Not implemented.
- 0001 Implemented. This value is permitted only if the SIMDSP field is 0001.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

SIMDSP, bits [19:16]
Advanced SIMD Single Precision. Indicates whether the floating-point and Advanced SIMD implementation provides single-precision floating-point instructions. Defined values are:

- 0000 Not implemented.
- 0001 Implemented. This value is permitted only if the SIMDInt field is 0001.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

SIMDInt, bits [15:12]
Advanced SIMD Integer. Indicates whether the floating-point and Advanced SIMD implementation provides integer instructions. Defined values are:

- 0000 Not implemented.
- 0001 Implemented.

All other values are reserved.
In ARMv8-A the only permitted value is 0001.

**SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the floating-point and Advanced SIMD implementation provides load/store instructions. Defined values are:

- **0000**: Not implemented.
- **0001**: Implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**FPDNaN, bits [7:4]**

Default NaN mode. Indicates whether the VFP hardware implementation supports only the Default NaN mode. Defined values are:

- **0000**: Hardware supports only the Default NaN mode.
- **0001**: Hardware supports propagation of NaN values.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**FPFtZ, bits [3:0]**

Flush to Zero mode. Indicates whether the VFP hardware implementation supports only the Flush-to-Zero mode of operation. Defined values are:

- **0000**: Hardware supports only the Flush-to-Zero mode of operation.
- **0001**: Hardware supports full denormalized number arithmetic.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**Accessing the MVFR1:**

To access the MVFR1:

VMRS <Rt>, MVFR1 ; Read MVFR1 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>spec_reg</th>
</tr>
</thead>
<tbody>
<tr>
<td>0110</td>
</tr>
</tbody>
</table>
G6.2.107 MVFR2, Media and VFP Feature Register 2

The MVFR2 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>Config-RO</td>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>Config-RO</td>
<td>Config-RO</td>
</tr>
</tbody>
</table>

Must be interpreted with MVFR0 and MVFR1.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If CPTR_EL2.TFP==1, Non-secure PL1 read accesses to this register are trapped to EL2.

If CPTR_EL3.TFP==1, PL1 and PL2 read accesses to this register are trapped to EL3.

If HCR.TID3==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TID3==1, Non-secure PL1 read accesses to this register are trapped to EL2.

If CPACR.cp<n>=00, PL1 read accesses to this register are UNDEFINED.

If CPACR.cp<n>=10, Reserved.

If CPACR.cp<n>=11, Full access.

If NSACR.cp<n>=0, Non-secure PL1 and PL2 read accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MVFR2 is architecturally mapped to AArch64 System register MVFR2_EL1.

Implemented only if the implementation includes floating-point and Advanced SIMD instructions.

**Attributes**

MVFR2 is a 32-bit register.

**Field descriptions**

The MVFR2 bit assignments are:
Bits [31:8]
Reserved, RES0.

FPMisc, bits [7:4]
Indicates support for miscellaneous VFP features.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>No support for miscellaneous features.</td>

</tbody>
</table>
G6.2.108  NMRR, Normal Memory Remap Register

The NMRR characteristics are:

Purpose

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the PRRR.

Usage constraints

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

NMRR(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

NMRR(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

NMRR is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Used in conjunction with the PRRR.

Only accessible when TTBCR.EAE==0. When TTBCR.EAE==1, the MAIR1 is accessed.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.
If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
If HCR_EL2.TRVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.
If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.
If HISTR.T10==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
If HISTR_EL2.T10==1, Non-secure EL1 accesses to this register are trapped to EL2.

Configurations

AArch32 System register NMRR is architecturally mapped to AArch64 System register MAIR_EL1[63:32] when TTBCR.EAE==0.
When EL3 is using AArch32, write access to NMRR(S) is disabled when the CP15SDisable signal is asserted HIGH.
RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.
Attributes

NMRR is a 32-bit register.

Field descriptions

The NMRR bit assignments are:

When TTBCR.EAE==0:

<table>
<thead>
<tr>
<th>OR&lt;n&gt;, bits [2n+17:2n+16], for n = 0 to 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outer Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR&lt;n&gt; entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:</td>
</tr>
<tr>
<td>00</td>
</tr>
<tr>
<td>01</td>
</tr>
<tr>
<td>10</td>
</tr>
<tr>
<td>11</td>
</tr>
<tr>
<td>The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>IR&lt;n&gt;, bits [2n+1:2n], for n = 0 to 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inner Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR&lt;n&gt; entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:</td>
</tr>
<tr>
<td>00</td>
</tr>
<tr>
<td>01</td>
</tr>
<tr>
<td>10</td>
</tr>
<tr>
<td>11</td>
</tr>
<tr>
<td>The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

Accessing the NMRR:

To access the NMRR when TTBCR.EAE==0:

MRC p15,0,<Rt>,c10,c2,1 ; Read NMRR into Rt
MCR p15,0,<Rt>,c10,c2,1 ; Write Rt to NMRR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1010</td>
<td>0010</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.109 NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

**Purpose**

Defines the Non-secure access permissions to Trace, Floating-point and Advanced SIMD functionality. Also includes additional IMPLEMENTATION DEFINED bits that define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is implemented and is using AArch64, any read or write to NSACR in Secure EL1 state in AArch32 is trapped as an exception to EL3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If **HSTR.T1==1**, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If **HSTR.EL2.T1==1**, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- If EL3 is not implemented, then any reads of the NSACR from Non-secure EL2 using AArch32 or Secure or Non-secure EL1 using AArch32 will return a fixed value of **0x00000C00**.
- If EL3 is implemented and is using AArch64, then any reads of the NSACR from Non-secure EL2 using AArch32 or Non-secure EL1 using AArch32 will return a fixed value of **0x00000C00**.

In AArch64, the NSACR functionality is replaced by the behavior in **CPTR_EL3**.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

**Attributes**

NSACR is a 32-bit register.
Field descriptions

The NSACR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-21</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>20</td>
<td>NSTRCDIS, bit [20]</td>
</tr>
<tr>
<td>19</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>18-16</td>
<td>IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>15</td>
<td>NSASEDIS, bit [15]</td>
</tr>
</tbody>
</table>

**Bits [31:21]**

Reserved, RES0.

**NSTRCDIS, bit [20]**

Disables Non-secure CP14 accesses to all implemented trace registers, from all Privilege levels.

- **0** There is no effect on CPACR.TRCDIS or HCPTR.TTA.
- **1** Non-secure accesses to all implemented trace registers are disabled:
  - CPACR.TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.
  - HCPTR.TTA behaves as RAO/WI, regardless of its actual value.

The implementation of this bit must correspond to the implementation of the CPACR.TRCDIS bit:

- If CPACR.TRCDIS is RAZ/WI, this bit is RAZ/WI.
- If CPACR.TRCDIS is RW, this bit is RW.

**Note**

- The ETMv4 architecture does not permit PL0 to access the trace registers. If the implementation includes an ETMv4 implementation, PL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

CP14 accesses to the trace registers can have side-effects. When a CP14 access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken. When this register has an architecturally-defined reset value, this field resets to 0.

**Bit [19]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [18:16]**

IMPLEMENTATION DEFINED.

**NSASEDIS, bit [15]**

Disables Non-secure accesses to the Advanced SIMD functionality, from all Privilege levels.

- **0** There is no effect on CPACR.ASEDIS or HCPTR.TASE.
- **1** Non-secure state accesses to the Advanced SIMD functionality are disabled:
  - CPACR.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.
  - HCPTR.TASE behaves as RAO/WI, regardless of its actual value.
The implementation of this bit must correspond to the implementation of the CPACR.ASEDIS bit:
- If CPACR.ASEDIS is RES0, this bit is RES0.
- If CPACR.ASEDIS is RAZ/WI, this bit is RAZ/WI.
- If CPACR.ASEDIS is RW, this bit is RW.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [14:12]**

Reserved, RES0.

**cp11, bit [11]**

The value of this bit is ignored. If this bit is programmed with a different value to the cp10 bit then this bit is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to an UNKNOWN value.

**cp10, bit [10]**

Enable Non-secure access to the Floating-point and Advanced SIMD functionality. Possible values of the fields are:

- **0**  
  Floating-point and Advanced SIMD features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED. If the PE is in Non-secure state, the corresponding bits in the CPACR ignore writes and read as 00, access denied.

- **1**  
  Floating-point and Advanced SIMD features can be accessed from both Security states.

If Non-secure access to the Floating-point and Advanced SIMD functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The floating-point and Advanced SIMD features controlled by these fields are:
- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED value, that might be UNKNOWN.

**Bits [9:0]**

Reserved, RES0.

### Accessing the NSACR:

To access the NSACR:

- **MRC p15,0,<Rt>,c1,c1,2** ; Read NSACR into Rt
- **MCR p15,0,<Rt>,c1,c1,2** ; Write Rt to NSACR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0001</td>
<td>0001</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.110 PAR, Physical Address Register

The PAR characteristics are:

Purpose

Returns the output address from any address translation operation.

Usage constraints

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

PAR(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

PAR(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

PAR is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies:
  - For a result returned to a 32-bit PAR, to the NOS, SH, Inner, and Outer fields.
  - For a result returned to a 64-bit PAR, to the ATTR and SH fields.
- See the NS bit description for constraints on the value it returns.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T7==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T7==1, Non-secure EL1 accesses to this register are trapped to EL2.

Configurations

AArch32 System register PAR is architecturally mapped to AArch64 System register PAR_EL1.

The PAR returns a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.
- When the PE is in Hyp mode for the ATS12NSOxx instructions when the value of HCR.VM is 0 and the value of TTBCR.EAE is 0.
In these cases, PAR[63:32] is RES0.

Otherwise, the PAR returns a 64-bit value. This means it returns a 64-bit value in the following cases:

- When using the Long-descriptor translation table format.
- If the stage 1 MMU is disabled and TTBCR.EAE is set to 1.
- In an implementation that includes EL2, for the result of an ATS1Cxx instruction performed from Hyp mode.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

When the PE is in a mode other than Hyp mode, TTBCR.EAE selects the translation table format.

**Field descriptions**

The PAR bit assignments are:

**For all register layouts:**

F, bit [0]

When updating the PAR with the result of a translation operation, this bit indicates whether the conversion completed successfully.

0 The address translation operation completed successfully.

1 The address translation operation aborted.

Hardware does not interpret this bit in any way, and therefore software can set this bit to 0 or 1 without affecting operation.

**When the instruction returned a 32-bit value to the PAR, PAR.F==0:**

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>PA</td>
<td>NS</td>
<td>SS</td>
<td>F</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

PA, bits [31:12]

Output address. The output address corresponding to the supplied virtual address. This field returns address bits[31:12].

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

0 Indicates use of the Short-descriptor translation table formats. This indicates that the PAR returned a 32-bit value.

1 Indicates use of the Long-descriptor translation table formats. This indicates that the PAR returned a 64-bit value.
Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

**NOS, bit [10]**
Not Outer Shareable attribute for the region. Indicates whether Shareable physical memory is Outer Shareable:
- 0    Memory is Outer Shareable.
- 1    Memory is not Outer Shareable.
See the Usage constraints for more information about the value returned.

**NS, bit [9]**
Non-secure. The NS attribute for a translation table entry from a Secure translation regime.
For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.
For a result from a Non-secure translation regime, this bit is UNKNOWN.

**IMP DEF, bit [8]**
IMPLEMENTATION DEFINED.

**SH, bit [7]**
Shareable attribute for the region. Indicates whether the physical memory is Shareable:
- 0    Memory is Non-shareable.
- 1    Memory is Shareable.
See the Usage constraints for more information about the value returned.

**Inner[2:0], bits [6:4]**
Inner memory attributes for the region. Permitted values are:
- 00    Non-cacheable.
- 01    Device-nGnRnE.
- 011   Device-nGnRE.
- 10    Write-Back, Write-Allocate.
- 110   Write-Through.
- 111   Write-Back, no Write-Allocate.
The values 010 and 100 are reserved.
See the Usage constraints for more information about the value returned.

**Outer[1:0], bits [3:2]**
Outer memory attributes for the region. Permitted values are:
- 00    Non-cacheable.
- 01    Write-Back, Write-Allocate.
- 10    Write-Through, no Write-Allocate.
- 11    Write-Back, no Write-Allocate.
See the Usage constraints for more information about the value returned.

**SS, bit [1]**
Supersection. Used to indicate if the result is a Supersection:
- 0    Page is not a Supersection. That is, PAR[31:12] contains PA[31:12], regardless of the page size.
Page is part of a Supersection:
- \( \text{PAR}[31:24] \) contains \( \text{PA}[31:24] \).
- \( \text{PAR}[23:16] \) contains \( \text{PA}[39:32] \).
- \( \text{PAR}[15:12] \) contains \( 0b0000 \).

If an implementation supports less than 40 bits of physical address, the bits in the \( \text{PAR} \) field that correspond to physical address bits that are not implemented are \text{UNKNOWN}.

\textbf{F, bit [0]}

When updating the PAR with the result of a translation operation, this bit indicates whether the conversion completed successfully.

0 The address translation operation completed successfully.

Hardware does not interpret this bit in any way, and therefore software can set this bit to 0 or 1 without affecting operation.

\textit{When the instruction returned a 32-bit value to the PAR, PAR.F==1:}

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>7</th>
<th>6</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>FS</td>
<td>F</td>
<td>LPAE</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

\textbf{Bits [31:12]}

Reserved, RES0.

\textbf{LPAE, bit [11]}

When updating the PAR with the result of the translation operation, this bit is set as follows:

0 Indicates use of the Short-descriptor translation table formats. This indicates that the PAR returned a 32-bit value.

1 Indicates use of the Long-descriptor translation table formats. This indicates that the PAR returned a 64-bit value.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

\textbf{Bits [10:7]}

Reserved, RES0.

\textbf{FS, bits [6:1]}

Fault status bits. Bits [12,10,3:0] from the DFSR, indicating the source of the abort.

\textbf{F, bit [0]}

When updating the PAR with the result of a translation operation, this bit indicates whether the conversion completed successfully.

1 The address translation operation aborted.

Hardware does not interpret this bit in any way, and therefore software can set this bit to 0 or 1 without affecting operation.
When the instruction returned a 64-bit value to the PAR, PAR.F==0:

<table>
<thead>
<tr>
<th>63</th>
<th>56 55</th>
<th>40 39</th>
<th>12 11 10 9 8 7 6</th>
<th>1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTR</td>
<td>RES0</td>
<td>PA</td>
<td>NS</td>
<td>SH</td>
</tr>
</tbody>
</table>

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR0 and MAIR1.

See the Usage constraints for more information about the value returned.

**Bits [55:40]**

Reserved, RES0.

**PA, bits [39:12]**

Output address. The output address corresponding to the supplied virtual address. This field returns address bits[39:12].

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

- 0 Indicates use of the Short-descriptor translation table formats. This indicates that the PAR returned a 32-bit value.
- 1 Indicates use of the Long-descriptor translation table formats. This indicates that the PAR returned a 64-bit value.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

**IMP DEF, bit [10]**

IMPLEMENTATION DEFINED.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

**SH, bits [8:7]**

Shareability attribute, for the returned output address. Permitted values are:

- 00 Non-shareable.
- 10 Outer Shareable.
- 11 Inner Shareable.

The value 01 is reserved.

--- Note ---

This field returns the value 10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.
See the Usage constraints for more information about the value returned.

**Bits [6:1]**

Reserved, RES0.

**F, bit [0]**

When updating the PAR with the result of a translation operation, this bit indicates whether the conversion completed successfully.

0 The address translation operation completed successfully.

Hardware does not interpret this bit in any way, and therefore software can set this bit to 0 or 1 without affecting operation.

*When the instruction returned a 32-bit value to the PAR, PAR.F==1:*

**Bits [63:12]**

Reserved, RES0.

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

0 Indicates use of the Short-descriptor translation table formats. This indicates that the PAR returned a 32-bit value.

1 Indicates use of the Long-descriptor translation table formats. This indicates that the PAR returned a 64-bit value.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

**Bit [10]**

Reserved, RES0.

**FSTAGE, bit [9]**

Indicates the translation stage at which the translation aborted:

0 Translation aborted because of a fault in the stage 1 translation.

1 Translation aborted because of a fault in the stage 2 translation.

**S2WLK, bit [8]**

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

**Bit [7]**

Reserved, RES0.
FST, bits [6:1]

Fault status field. Values are as in the DFSR.STATUS and IFSR.STATUS fields (when using the Long-descriptor translation table format).

F, bit [0]

When updating the PAR with the result of a translation operation, this bit indicates whether the conversion completed successfully.

1 The address translation operation aborted.

Hardware does not interpret this bit in any way, and therefore software can set this bit to 0 or 1 without affecting operation.

Accessing the PAR:

To access the PAR when accessing as a 32-bit register:

MRC p15,0,<Rt>,c7,c4,0 ; Read PAR[31:0] into Rt
MCR p15,0,<Rt>,c7,c4,0 ; Write Rt to PAR[31:0]. PAR[63:32] are unchanged

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0111</td>
<td>0100</td>
<td>000</td>
</tr>
</tbody>
</table>

To access the PAR when accessing as a 64-bit register:

MRRC p15,0,<Rt>,<Rt2>,c7 ; Read PAR[31:0] into Rt and PAR[63:32] into Rt2
MCRR p15,0,<Rt>,<Rt2>,c7 ; Write Rt to PAR[31:0] and Rt2 to PAR[63:32]

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0000</td>
<td>0111</td>
</tr>
</tbody>
</table>
G6.2.111 PRRR, Primary Region Remap Register

The PRRR characteristics are:

**Purpose**

Controls the top level mapping of the TEX[0], C, and B memory region attributes.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

PRRR(S) is accessible as follows:

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

PRRR is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

PRRR(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

PRRR is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Only accessible when TTBCR.EAE==0. When TTBCR.EAE==1, the MAIR0 is accessed.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.

If HISTR.T0==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HISTR_EL2.T0==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register PRRR is architecturally mapped to AArch64 System register MAIR_EL1[31:0] when TTBCR.EAE==0.

When EL3 is using AArch32, write access to PRRR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PRRR is a 32-bit register.
Field descriptions

The PRRR bit assignments are:

When \( TTBCR.EAE=0 \):

\[
\begin{array}{cccccccccc}
31 & 30 & 29 & 28 & 27 & 26 & 25 & 24 & 23 & 20 \ 19 & 18 & 17 & 16 & 15 & 14 & 13 & 12 & 11 & 10 \ 8 & 7 & 6 & 5 & 4 & 3 & 2 & 1 & 0 \\
\hline
RES0 & TR7 & TR6 & TR5 & TR4 & TR3 & TR2 & TR1 & TR0
\end{array}
\]

NOS\(<n>\), bit \([n+24]\), for \(n+24 = 0 \) to \(7\)

NOS\(<n>\) is the Outer Shareable property mapping for memory attributes \(n\), if the region is mapped as Normal or Device memory that is Shareable. \(n\) is the value of the TEX\([0]\), C, and B bits concatenated. The possible values of each NOS\(<n>\) bit are:

- 0 Memory region is Outer Shareable.
- 1 Memory region is Inner Shareable.

The value of this bit is ignored if the region is Normal or Device memory that is Non-shareable.

The meaning of the field with \(n = 6\) is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination \(\{TEX[0] = 1, C = 1, B = 0\}\) is IMPLEMENTATION DEFINED.

If the implementation does not distinguish between Inner Shareable and Outer Shareable then these bits are reserved and are RES0.

Bits \([23:20]\)

Reserved, RES0.

NS1, bit \([19]\)

Mapping of \(S = 1\) attribute for Normal memory. This bit gives the mapped Shareability attribute for a region of memory that:

- Is mapped as Normal memory.
- Has the S bit set to 1.

The possible values of this bit are:

- 0 Region is Non-shareable.
- 1 Region is Shareable.

NS0, bit \([18]\)

Mapping of \(S = 0\) attribute for Normal memory. This bit gives the mapped Shareability attribute for a region of memory that:

- Is mapped as Normal memory.
• Has the S bit set to 0.

The possible values of this bit are:

0  Region is Non-shareable.
1  Region is Shareable.

DS1, bit [17]

Mapping of S = 1 attribute for Device memory. This bit gives the mapped Shareability attribute for a region of memory that is mapped to Device memory and has the S bit set to 1. In ARMv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

DS0, bit [16]

Mapping of S = 0 attribute for Device memory. This bit gives the mapped Shareability attribute for a region of memory that is mapped to Device memory and has the S bit set to 0. In ARMv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

TR<ν>, bits [2n+1:2n], for n = 0 to 7

TR<ν> is the primary TEX mapping for memory attributes ν, and defines the mapped memory type for a region with attributes ν. ν is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:

00  Device-νGνRνE memory
01  Device-νGνRE memory
10  Normal memory
The value 11 is reserved.

The meaning of the field with ν = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

Accessing the PRRR:

To access the PRRR when TTBCR.EAE==0:

MRC p15,0,<Rt>,c10,c2,0 ; Read PRRR into Rt
MCR p15,0,<Rt>,c10,c2,0 ; Write Rt to PRRR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1010</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.112 REVIDR, Revision ID Register

The REVIDR characteristics are:

**Purpose**

Provides implementation-specific minor revision information.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID1==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID1==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states. AArch32 System register REVIDR is architecturally mapped to AArch64 System register REVIDR_EL1.

If REVIDR has the same value as MIDR, then its contents have no significance.

**Attributes**

REVIDR is a 32-bit register.

**Field descriptions**

The REVIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.
Accessing the REVIDR:

To access the REVIDR:

MRC p15,0,<Rt>,c0,c0,6 ; Read REVIDR into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0000</td>
<td>110</td>
</tr>
</tbody>
</table>
G6.2.113  RMR (at EL1), Reset Management Register

The RMR (at EL1) characteristics are:

Purpose

If this register's Exception level is the highest implemented Exception level:

- A write to the register can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, specifies the Execution state that the PE boots into on a Warm reset.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables

There are no traps or enables affecting this register.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register RMR (at EL1) is architecturally mapped to AArch64 System register RMR_EL1.

Only implemented if this register's Exception level is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

When this register is not implemented its encoding is UNDEFINED at EL1.

See the field descriptions for the reset values. These apply whenever the register is implemented.

Attributes

RMR (at EL1) is a 32-bit register.

Field descriptions

The RMR (at EL1) bit assignments are:

**When EL2 and EL3 not implemented:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>2</td>
<td>RR</td>
</tr>
<tr>
<td>1</td>
<td>AA64</td>
</tr>
</tbody>
</table>

Bits [31:2]

Reserved, RES0.
RR, bit [1]

Setting this bit to 1 requests a Warm reset.

This field resets to 0. This reset value applies on Cold and Warm resets.

AA64, bit [0]

When the highest implemented Exception level can use AArch32, determines which Execution state
the PE boots into after a Warm reset:

0  AArch32.
1  AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector
address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

This field resets to 0. This reset value applies on Cold reset.

Accessing the RMR (at EL1):

To access the RMR (at EL1) when EL2 and EL3 not implemented:

MRC p15,0,<Rt>,c12,c0,2 ; Read RMR into Rt
MCR p15,0,<Rt>,c12,c0,2 ; Write Rt to RMR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.114  RMR (at EL3), Reset Management Register

The RMR (at EL3) characteristics are:

**Purpose**

If this register’s Exception level is the highest implemented Exception level:

- A write to the register can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, specifies the Execution state that the PE boots into on a Warm reset.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is implemented, the AArch32 view of the RMR register is subject to **CP15SDISABLE**, which prevents writing to this register when the **CP15SDISABLE** signal is asserted.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register RMR (at EL3) is architecturally mapped to AArch64 System register **RMR_EL3**.

Only implemented if this register’s Exception level is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

When this register is not implemented its encoding is **UNDEFINED** at EL3.

See the field descriptions for the reset values. These apply whenever the register is implemented.

**Attributes**

RMR (at EL3) is a 32-bit register.

**Field descriptions**

The RMR (at EL3) bit assignments are:
**When EL3 implemented:**

![Register Diagram](image)

**Bits [31:2]**

Reserved, RES0.

**RR, bit [1]**

Setting this bit to 1 requests a Warm reset.

This field resets to 0. This reset value applies on Cold and Warm resets.

**AA64, bit [0]**

When the highest implemented Exception level can use AArch32, determines which Execution state the PE boots into after a Warm reset:

0  AArch32.
1  AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

This field resets to 0. This reset value applies on Cold reset.

**Accessing the RMR (at EL3):**

To access the RMR (at EL3) when EL3 implemented:

- MRC p15,0,<Rt>,c12,c0,2 ; Read RMR into Rt
- MCR p15,0,<Rt>,c12,c0,2 ; Write Rt to RMR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.115   RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

**Purpose**

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

**Usage constraints**

If EL1 is the highest exception level implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL2 is the highest exception level implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RO</td>
</tr>
</tbody>
</table>

This register can only be read at the highest Exception level implemented. It is UNDEFINED at all other Exception levels.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If `HSTR.T12==1`, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If `HSTR_EL2.T12==1`, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

This register is only implemented if the highest Exception level implemented is capable of using AArch32, and is not EL3.

**Attributes**

RVBAR is a 32-bit register.

**Field descriptions**

The RVBAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES1</td>
</tr>
<tr>
<td>Reset Address[31:1]</td>
<td></td>
</tr>
</tbody>
</table>
Bits [31:1]

Reset Address[31:1]. Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

Bit [0]

Reserved, RES1.

Accessing the RVBAR:

To access the RVBAR:

MRC p15, 0, <Rt>, c12, c0, 1 ; Read RVBAR into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.116 SCR, Secure Configuration Register

The SCR characteristics are:

**Purpose**

Defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External Abort occurs.
- Whether the CPSR.F or CPSR.A bits can be modified when SCR.NS==1.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1 (NS)</th>
<th>EL1 (S)</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, accesses to the SCR are UNDEFINED.

If EL3 is implemented and is using AArch64, Secure EL1 accesses to this register are trapped to EL3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register SCR can be mapped to AArch64 System register SCR_EL3, but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

**Attributes**

SCR is a 32-bit register.

**Field descriptions**

The SCR bit assignments are:
Bits [31:14]
Reserved, RES0.

TWE, bit [13]
Traps WFE instructions to Monitor mode.

0 This control has no effect on the execution of WFE instructions.

1 Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2.

Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note
Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 0.

TWI, bit [12]
Traps WFI instructions to Monitor mode.

0 This control has no effect on the execution of WFI instructions.

1 Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2.

Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.
Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [11:10]**

Reserved, RES0.

**SIF, bit [9]**

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory. The possible values for this bit are:

0 Secure state instruction fetches from Non-secure memory are permitted.
1 Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

**HCE, bit [8]**

Hypervisor Call instruction enable. Enables PL2 and Non-secure PL1 execution of HVC instructions.

0 HVC instructions are:
- UNDEFINED at Non-secure PL1. The Undefined Instruction exception is taken from PL1 to PL1.
- UNPREDICTABLE at PL2. Behavior is one of the following:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

1 HVC instructions are enabled at PL2 and Non-secure PL1.

--- **Note** ---

HVC instructions are always UNDEFINED at PL0 and in Secure state.

---

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

When this register has an architecturally-defined reset value, this field resets to 0.

**SCD, bit [7]**

Secure Monitor Call disable. Disables SMC instructions.

0 SMC instructions are enabled.

1 In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level.

In Secure state, behavior is one of the following:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.

--- **Note** ---

SMC instructions are always UNDEFINED at PL0.

---

When this register has an architecturally-defined reset value, this field resets to 0.
nET, bit [6]

Not Early Termination. This bit disables early termination. The possible values of this bit are:

- **0**: Early termination permitted. Execution time of data operations can depend on the data values.
- **1**: Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.

This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.

AW, bit [5]

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether CPSR.A masks an external abort taken from Non-secure state, and the possible values of this bit are:

- **0**: External aborts taken from Non-secure state are not masked by CPSR.A, and are taken to EL3.
  - External aborts taken from Secure state are masked by CPSR.A.
- **1**: External aborts taken from either Security state are masked by CPSR.A. When CPSR.A is 0, the abort is taken to EL3.

When SCR.EA is 0 or HCR.AMO is 1, this bit has no effect.

When this register has an architecturally-defined reset value, this field resets to 0.

FW, bit [4]

When the value of SCR.FIQ is 1 and the value of HCR.FMO is 0, this bit controls whether CPSR.F masks an FIQ interrupt taken from Non-secure state, and the possible values of this bit are:

- **0**: An FIQ taken from Non-secure state is not masked by CPSR.F, and is taken to EL3.
  - An FIQ taken from Secure state is masked by CPSR.F.
- **1**: An FIQ taken from either Security state is masked by CPSR.F. When CPSR.F is 0, the FIQ is taken to EL3.

When SCR.FIQ is 0 or HCR.FMO is 1, this bit has no effect.

When this register has an architecturally-defined reset value, this field resets to 0.

EA, bit [3]

External Abort handler. This bit controls which mode takes external aborts. The possible values of this bit are:

- **0**: External aborts taken to Abort mode.
- **1**: External aborts taken to Monitor mode.

When this register has an architecturally-defined reset value, this field resets to 0.

FIQ, bit [2]

FIQ handler. This bit controls which mode takes FIQ exceptions. The possible values of this bit are:

- **0**: FIQs taken to FIQ mode.
- **1**: FIQs taken to Monitor mode.

When this register has an architecturally-defined reset value, this field resets to 0.

IRQ, bit [1]

IRQ handler. This bit controls which mode takes IRQ exceptions. The possible values of this bit are:

- **0**: IRQs taken to IRQ mode.
- **1**: IRQs taken to Monitor mode.
When this register has an architecturally-defined reset value, this field resets to 0.

**NS, bit [0]**

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

0 PE is in Secure state.
1 PE is in Non-secure state.

If the HCR.TGE bit is set, an attempt to change from a Secure PL1 mode to a Non-secure PL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the SCR:**

To access the SCR:

\[ \text{MRC p15,0,<Rt>,c1,c1,0} \] ; Read SCR into Rt
\[ \text{MCR p15,0,<Rt>,c1,c1,0} \] ; Write Rt to SCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0001</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.117  SCTLR, System Control Register

The SCTLR characteristics are:

**Purpose**

Provides the top level control of the system, including its memory system.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

SCTLR(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

SCTLR(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

SCTLR is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.

If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.

If HCR_EL2.TRVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.

If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.

If HISTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HISTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register SCTLR is architecturally mapped to AArch64 System register SCTLR_EL1.

When EL3 is using AArch32, write access to SCTLR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.
Some or all RW fields of this register have defined reset values. These apply only if the PE resets
into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply
only to the Secure instance of the register. Otherwise, RW fields in this register reset to
IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes
SCTLR is a 32-bit register.

Field descriptions
The SCTLR bit assignments are:

Bit [31]  
Reserved, RES0.

TE, bit [30]  
T32 Exception Enable. This bit controls whether exceptions to an Exception Level that is executing
at PL1 are taken to A32 or T32 state:

0     Exceptions, including reset, taken to A32 state.
1     Exceptions, including reset, taken to T32 state.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION
DEFINED choice between:

• 0.
• A value determined by an input configuration signal.

AFE, bit [29]  
Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0
translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access
flag, and restricts access permissions in the translation descriptors to the simplified model. The
possible values of this bit are:

0     In the translation table descriptors, AP[0] is an access permissions bit. The full range of
access permissions is supported. No Access flag is implemented.
1     In the translation table descriptors, AP[0] is the Access flag. Only the simplified model
for access permissions is supported.
When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit. The AFE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

**TRE, bit [28]**

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA. The possible values of this bit are:

- 0: TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.
- 1: TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.

The TRE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [27:26]**

Reserved, RES0.

**EE, bit [25]**

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

- 0: Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian.
- 1: Big-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support for data accesses at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception Levels higher than EL0, this bit is RES1.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED choice between:

- 0.
- A value determined by an input configuration signal.

**Bit [24]**

Reserved, RES0.

**Bits [23:22]**

Reserved, RES1.

**Bit [21]**

Reserved, RES0.
UWXN, bit [20]

Unprivileged write permission implies EL1 XN (Execute Never). This bit can be used to require all memory regions with unprivileged write permissions to be treated as XN for accesses from software executing at EL1. The possible values of this bit are:

0  Regions with unprivileged write permission are not forced to XN.
1  Regions with unprivileged write permission are forced to XN for accesses from software executing at EL1.

The UWXN bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

WXN, bit [19]

Write permission implies XN (Execute Never). This bit can be used to require all memory regions with write permission to be treated as XN for the PL1&0 translation regime. The possible values of this bit are:

0  Regions with write permission are not forced to XN.
1  Regions with write permission are forced to XN for the PL1&0 translation regime.

The WXN bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

nTWE, bit [18]

Traps PL0 execution of WFE instructions to Undefined mode.

0  Any attempt to execute a WFE instruction at PL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
1  This control has no effect on the PL0 execution of WFE instructions.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

——— Note ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

———

When this register has an architecturally-defined reset value, this field resets to 1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps PL0 execution of WFI instructions to Undefined mode.

0  Any attempt to execute a WFI instruction at PL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
1  This control has no effect on the PL0 execution of WFI instructions.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

——— Note ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

———

When this register has an architecturally-defined reset value, this field resets to 1.
Bits [15:14]

Reserved, RES0.

V, bit [13]

Vectors bit. This bit selects the base address of the exception vectors:
0 Normal exception vectors. Base address is held in:
  • VBAR for an exception taken to a PE mode other than Hyp mode and Monitor mode.
  • HVBAR for an exception taken to Hyp mode.
  • MVBAR for an exception taken to Monitor mode.
1 High exception vectors (Hivecs), base address 0xFFFF0000. This base address is never remapped.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED choice between:
  • 0.
  • A value determined by an input configuration signal.

I, bit [12]

Instruction cache enable. This is a global enable bit for instruction caches:
0 All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache.
  If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
1 All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache.
  If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the HCR.DC bit is 1, then instruction access to Normal memory from PL1 and PL0 are Cacheable regardless of the value of the SCTLR.I bit.

When this register has an architecturally-defined reset value, this field resets to 0.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.
0 SETEND instruction execution is enabled at PL0 and PL1.
1 SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When this register has an architecturally-defined reset value, this field resets to 0.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.
0 All IT instruction functionality is enabled at PL1 and PL0.
Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with hw1[3:0]!=1000.
- All encodings of the subsequent instruction with the following values for hw1:
  11xxxxxxxxxxxx
  All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
  1011xxxxxxxxxxxx
  All instructions in Miscellaneous 16-bit instructions on page F3-2536.
  10100xxxxxxxxxxx
  ADD Rd, PC, #imm
  01001xxxxxxxxxxx
  LDR Rd, [PC, #imm]
  0100x1xxx1111xxx
  ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
  010001xx1xxxx111
  ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

When this register has an architecturally-defined reset value, this field resets to 0.

**UNK, bit [6]**

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

**CP15BEN, bit [5]**

CP15 barrier operation instruction enable. Enables accesses to the CP15 DMB, DSB, and ISB barrier operations from PL1 and PL0:

0  PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
1  PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

When this register has an architecturally-defined reset value, this field resets to 1.

**Bits [4:3]**

Reserved, RES1.

**C, bit [2]**

Cache enable, for data caching.

0  All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.
1  All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.
When the value of the HCR.DC bit is 1, then data access to Normal memory from PL1 and PL0, and accesses to the PL1&0 stage 1 translation tables, can be cached regardless of the value of the SCTLR.C bit.

When this register has an architecturally-defined reset value, this field resets to 0.

A, bit [1]
Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

0  Alignment fault checking disabled when executing at PL1 or PL0.
Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

1  Alignment fault checking enabled when executing at PL1 or PL0.
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.
Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When this register has an architecturally-defined reset value, this field resets to 0.

M, bit [0]
MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

0  EL1 and EL0 stage 1 address translation disabled.
See the SCTLR.I field for the behavior of instruction accesses to Normal memory.

1  EL1 and EL0 stage 1 address translation enabled.

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with SCTLR.M being 0, regardless of the actual value of SCTLR.M, other than the value returned by an explicit read of SCTLR.M.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the SCTLR:

To access the SCTLR:

MRC p15,0,<Rt>,c1,c0,0 ; Read SCTLR into Rt
MCR p15,0,<Rt>,c1,c0,0 ; Write Rt to SCTLR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0001</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.118  SPSR, Saved Program Status Register

The SPSR characteristics are:

**Purpose**

Holds the saved process state for the current mode.

**Usage constraints**

The SPSR can be read using the MRS instruction and written using the MSR (immediate) or MSR (register) instructions. For more details on the instruction syntax, see *PSTATE and banked register access instructions* on page F1-2490.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

SPSR is a 32-bit register.

**Field descriptions**

The SPSR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>[31]</td>
<td>Set to the value of CPSR.N on taking an exception to the current mode, and copied to CPSR.N on executing an exception return operation in the current mode.</td>
</tr>
<tr>
<td>Z</td>
<td>[30]</td>
<td>Set to the value of CPSR.Z on taking an exception to the current mode, and copied to CPSR.Z on executing an exception return operation in the current mode.</td>
</tr>
<tr>
<td>C</td>
<td>[29]</td>
<td>Set to the value of CPSR.C on taking an exception to the current mode, and copied to CPSR.C on executing an exception return operation in the current mode.</td>
</tr>
<tr>
<td>V</td>
<td>[28]</td>
<td>Set to the value of CPSR.V on taking an exception to the current mode, and copied to CPSR.V on executing an exception return operation in the current mode.</td>
</tr>
<tr>
<td>Q</td>
<td>[27]</td>
<td>Set to the value of CPSR.Q on taking an exception to the current mode, and copied to CPSR.Q on executing an exception return operation in the current mode.</td>
</tr>
<tr>
<td>IT[1:0]</td>
<td>[26:25]</td>
<td>If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.</td>
</tr>
</tbody>
</table>

**Notes**

- **IT** field:
  - **IT[7:2]**: If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
  - **IT[1:0]**: If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
J, bit [24]  
RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. 
ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bits [23:21]  
Reserved, RES0.

IL, bit [20]  
Illegal Execution State bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]  
Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]  
If-Then Execution State bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.
• IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
• IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]  
Endianness Execution State bit. Controls the load and store endianness for data accesses:
0 Little-endian operation
1 Big-endian operation.
Instruction fetches ignore this bit.
When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.
If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.
If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]  
Asynchronous data abort mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

I, bit [7]  
IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]  
FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

- 0: Taken from A32 state.
- 1: Taken from T32 state.

**M[4], bit [4]**

Execution state that the exception was taken from. Possible values of this bit are:

- 1: Exception taken from AArch32.

**M[3:0], bits [3:0]**

AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>User</td>
</tr>
<tr>
<td>0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0110</td>
<td>Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)</td>
</tr>
<tr>
<td>0111</td>
<td>Abort</td>
</tr>
<tr>
<td>1010</td>
<td>Hyp</td>
</tr>
<tr>
<td>1011</td>
<td>Undefined</td>
</tr>
<tr>
<td>1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved.
G6.2.119  **SPSR_abt, Saved Program Status Register (Abort mode)**

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS, IABT)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

This register is only accessible at EL1 in modes other than Abort mode. In Abort mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register SPSR_abt is architecturally mapped to AArch64 System register SPSR_abt.

**Attributes**

SPSR_abt is a 32-bit register.

**Field descriptions**

The SPSR_abt bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 21 20 19</th>
<th>16 15</th>
<th>10 9 8 7 6 5 4 3 2</th>
<th>1 0</th>
</tr>
</thead>
</table>

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Abort mode, and copied to CPSR.N on executing an exception return operation in Abort mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Abort mode, and copied to CPSR.Z on executing an exception return operation in Abort mode.
C, bit [29]
Set to the value of CPSR.C on taking an exception to Abort mode, and copied to CPSR.C on executing an exception return operation in Abort mode.

V, bit [28]
Set to the value of CPSR.V on taking an exception to Abort mode, and copied to CPSR.V on executing an exception return operation in Abort mode.

Q, bit [27]
Set to the value of CPSR.Q on taking an exception to Abort mode, and copied to CPSR.Q on executing an exception return operation in Abort mode.

IT[1:0], bits [26:25]
If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

J, bit [24]
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bits [23:21]
Reserved, RES0.

IL, bit [20]
Illegal Execution State bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]
If-Then Execution State bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

• IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
• IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]
Endianness Execution State bit. Controls the load and store endianness for data accesses:
0 Little-endian operation
1 Big-endian operation.
Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]
Asynchronous data abort mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

I, bit [7]
IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]
FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

T, bit [5]
T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
0 Taken from A32 state.
1 Taken from T32 state.

M[4], bit [4]
Execution state that the exception was taken from. Possible values of this bit are:
1 Exception taken from AArch32.

M[3:0], bits [3:0]
AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0b0110</td>
<td>Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined</td>
</tr>
<tr>
<td>0b1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved.

**Accessing the SPSR_abt:**

To access the SPSR_abt:

MRS <Rd>, SPSR_abt ; Read SPSR_abt into Rd
MSR SPSR_abt, <Rd> ; Write Rd to SPSR_abt
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>m</th>
<th>m1</th>
<th>R</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0100</td>
<td>1</td>
</tr>
</tbody>
</table>
### G6.2.120 SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS, IFIQ)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

This register is only accessible at EL1 in modes other than FIQ mode. In FIQ mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states. AArch32 System register SPSR_fiq is architecturally mapped to AArch64 System register SPSR_fiq.

**Attributes**

SPSR_fiq is a 32-bit register.

**Field descriptions**

The SPSR_fiq bit assignments are:

- **N, bit [31]**

  Set to the value of CPSR.N on taking an exception to FIQ mode, and copied to CPSR.N on executing an exception return operation in FIQ mode.

- **Z, bit [30]**

  Set to the value of CPSR.Z on taking an exception to FIQ mode, and copied to CPSR.Z on executing an exception return operation in FIQ mode.
C, bit [29]
Set to the value of CPSR.C on taking an exception to FIQ mode, and copied to CPSR.C on executing an exception return operation in FIQ mode.

V, bit [28]
Set to the value of CPSR.V on taking an exception to FIQ mode, and copied to CPSR.V on executing an exception return operation in FIQ mode.

Q, bit [27]
Set to the value of CPSR.Q on taking an exception to FIQ mode, and copied to CPSR.Q on executing an exception return operation in FIQ mode.

IT[1:0], bits [26:25]
If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

J, bit [24]
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bits [23:21]
Reserved, RES0.

IL, bit [20]
Illegal Execution State bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]
If-Then Execution State bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.
- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]
Endianness Execution State bit. Controls the load and store endianness for data accesses:
0   Little-endian operation
1   Big-endian operation.
Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.
If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.
If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]
Asynchronous data abort mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

I, bit [7]
IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]
FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

T, bit [5]
T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
0 Taken from A32 state.
1 Taken from T32 state.

M[4], bit [4]
Execution state that the exception was taken from. Possible values of this bit are:
1 Exception taken from AArch32.

M[3:0], bits [3:0]
AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>User</td>
</tr>
<tr>
<td>0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0110</td>
<td>Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)</td>
</tr>
<tr>
<td>0111</td>
<td>Abort</td>
</tr>
<tr>
<td>1011</td>
<td>Undefined</td>
</tr>
<tr>
<td>1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved.

Accessing the SPSR_fiq:
To access the SPSR_fiq:

MRS <Rd>, SPSR_fiq ; Read SPSR_fiq into Rd
MSR SPSR_fiq, <Rd> ; Write Rd to SPSR_fiq
Register access is encoded as follows:

<table>
<thead>
<tr>
<th></th>

</tbody>
</table>
G6.2.121  SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

In Hyp mode, this register is accessible as the current SPSR.

Traps and Enables

There are no traps or enables affecting this register.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register SPSR_hyp is architecturally mapped to AArch64 System register SPSR_EL2.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions

The SPSR_hyp bit assignments are:

\[
\begin{array}{cccccccccccccc}
\end{array}
\]

N, bit [31]

Set to the value of CPSR.N on taking an exception to Hyp mode, and copied to CPSR.N on executing an exception return operation in Hyp mode.

Z, bit [30]

Set to the value of CPSR.Z on taking an exception to Hyp mode, and copied to CPSR.Z on executing an exception return operation in Hyp mode.
C, bit [29]
Set to the value of CPSR.C on taking an exception to Hyp mode, and copied to CPSR.C on
executing an exception return operation in Hyp mode.

V, bit [28]
Set to the value of CPSR.V on taking an exception to Hyp mode, and copied to CPSR.V on
executing an exception return operation in Hyp mode.

Q, bit [27]
Set to the value of CPSR.Q on taking an exception to Hyp mode, and copied to CPSR.Q on
executing an exception return operation in Hyp mode.

IT[1:0], bits [26:25]
If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this
field.

J, bit [24]
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.
ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction
set state.

Bits [23:21]
Reserved, RES0.

IL, bit [20]
Illegal Execution State bit. Shows the value of PSTATE.IL immediately before the exception was
taken.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]
If-Then Execution State bits for the T32 IT (If-Then) instruction. This field must be interpreted in
two parts.
• IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the
  condition code specified by the first condition field of the IT instruction.
• IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be
  conditionally executed, by the position of the least significant 1 in this field. It also encodes
  the value of the least significant bit of the condition code for each instruction in the block.
  The IT field is 0b00000000 when no IT block is active.

E, bit [9]
Endianness Execution State bit. Controls the load and store endianness for data accesses:
0 Little-endian operation
1 Big-endian operation.
Instruction fetches ignore this bit.
When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also
applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.
If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide
Little-endian support, this bit is RES1.
If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception
return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**
Asynchronous data abort mask bit. The possible values of this bit are:
- 0 Exception not masked.
- 1 Exception masked.

**I, bit [7]**
IRQ mask bit. The possible values of this bit are:
- 0 Exception not masked.
- 1 Exception masked.

**F, bit [6]**
FIQ mask bit. The possible values of this bit are:
- 0 Exception not masked.
- 1 Exception masked.

**T, bit [5]**
T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
- 0 Taken from A32 state.
- 1 Taken from T32 state.

**M[4], bit [4]**
Execution state that the exception was taken from. Possible values of this bit are:
- 1 Exception taken from AArch32.

**M[3:0], bits [3:0]**
AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined</td>
</tr>
<tr>
<td>0b1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved.

**Accessing the SPSR_hyp:**

To access the SPSR_hyp:

- MRS <Rd>, SPSR_hyp; Read SPSR_hyp into Rd
- MSR SPSR_hyp, <Rd>; Write Rd to SPSR_hyp
Register access is encoded as follows:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1110</td>
<td>1</td>
</tr>
</tbody>
</table>
G6.2.122  SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to IRQ mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS, IRQ)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RW</td>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RW</td>
</tr>
</tbody>
</table>

This register is only accessible at EL1 in modes other than IRQ mode. In IRQ mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register SPSR_irq is architecturally mapped to AArch64 System register SPSR_irq.

**Attributes**

SPSR_irq is a 32-bit register.

**Field descriptions**

The SPSR_irq bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 21 | 20 | 19 | 16 | 15 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | J  | RES0| IL | GE | IT[7:2]| E | A | I | F | T | M[3:0] |

```

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to IRQ mode, and copied to CPSR.N on executing an exception return operation in IRQ mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to IRQ mode, and copied to CPSR.Z on executing an exception return operation in IRQ mode.
C, bit [29]
Set to the value of CPSR.C on taking an exception to IRQ mode, and copied to CPSR.C on executing an exception return operation in IRQ mode.

V, bit [28]
Set to the value of CPSR.V on taking an exception to IRQ mode, and copied to CPSR.V on executing an exception return operation in IRQ mode.

Q, bit [27]
Set to the value of CPSR.Q on taking an exception to IRQ mode, and copied to CPSR.Q on executing an exception return operation in IRQ mode.

IT[1:0], bits [26:25]
If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

J, bit [24]
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bits [23:21]
Reserved, RES0.

IL, bit [20]
Illegal Execution State bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]
If-Then Execution State bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.
• IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
• IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block. The IT field is 0b00000000 when no IT block is active.

E, bit [9]
Endianness Execution State bit. Controls the load and store endianness for data accesses:
0 Little-endian operation
1 Big-endian operation.
Instruction fetches ignore this bit.
When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.
If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.
If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]
Asynchronous data abort mask bit. The possible values of this bit are:

0  Exception not masked.
1  Exception masked.

I, bit [7]
IRQ mask bit. The possible values of this bit are:

0  Exception not masked.
1  Exception masked.

F, bit [6]
FIQ mask bit. The possible values of this bit are:

0  Exception not masked.
1  Exception masked.

T, bit [5]
T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

0  Taken from A32 state.
1  Taken from T32 state.

M[4], bit [4]
Execution state that the exception was taken from. Possible values of this bit are:

1  Exception taken from AArch32.

M[3:0], bits [3:0]
AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>User</td>
</tr>
<tr>
<td>0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0110</td>
<td>Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)</td>
</tr>
<tr>
<td>0111</td>
<td>Abort</td>
</tr>
<tr>
<td>1111</td>
<td>Undefined</td>
</tr>
</tbody>
</table>

Other values are reserved.

**Accessing the SPSR_irq:**

To access the SPSR_irq:

MRS <Rd>, SPSR_irq ; Read SPSR_irq into Rd
MSR SPSR_irq, <Rd> ; Write Rd to SPSR_irq
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>m</th>
<th>m1</th>
<th>R</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>000</td>
<td>1</td>
</tr>
</tbody>
</table>
G6.2.123  SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Monitor mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1, !Mon)</th>
<th>EL3 (SCR.NS=0, !Mon)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>-</td>
</tr>
</tbody>
</table>

This register is only accessible at EL3 in modes other than Monitor mode. In Monitor mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register SPSR_mon can be mapped to AArch64 System register SPSR_EL3, but this is not architecturally mandated.

**Attributes**

SPSR_mon is a 32-bit register.

**Field descriptions**

The SPSR_mon bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**N, bit [31]**

Set to the value of CPSR.N on taking an exception to Monitor mode, and copied to CPSR.N on executing an exception return operation in Monitor mode.

**Z, bit [30]**

Set to the value of CPSR.Z on taking an exception to Monitor mode, and copied to CPSR.Z on executing an exception return operation in Monitor mode.
C, bit [29]
Set to the value of CPSR.C on taking an exception to Monitor mode, and copied to CPSR.C on executing an exception return operation in Monitor mode.

V, bit [28]
Set to the value of CPSR.V on taking an exception to Monitor mode, and copied to CPSR.V on executing an exception return operation in Monitor mode.

Q, bit [27]
Set to the value of CPSR.Q on taking an exception to Monitor mode, and copied to CPSR.Q on executing an exception return operation in Monitor mode.

IT[1:0], bits [26:25]
If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

J, bit [24]
RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bits [23:21]
Reserved, RES0.

IL, bit [20]
Illegal Execution State bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]
If-Then Execution State bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.
• IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
• IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.
The IT field is 0b00000000 when no IT block is active.

E, bit [9]
Endianness Execution State bit. Controls the load and store endianness for data accesses:
0 Little-endian operation
1 Big-endian operation.
Instruction fetches ignore this bit.
When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.
If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.
If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]
Asynchronous data abort mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

I, bit [7]
IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]
FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

T, bit [5]
T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
0 Taken from A32 state.
1 Taken from T32 state.

M[4], bit [4]
Execution state that the exception was taken from. Possible values of this bit are:
1 Exception taken from AArch32.

M[3:0], bits [3:0]
AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>User</td>
</tr>
<tr>
<td>0001</td>

</tbody>
</table>
G6.2.124 SPSR_svc, Saved Program Status Register (Sup. Call mode)

The SPSR_svc characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Supervisor mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS, ISVC)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

This register is only accessible at EL1 in modes other than Supervisor mode. In Supervisor mode, it is accessible as the current SPSR.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register SPSR_svc is architecturally mapped to AArch64 System register SPSR_EL1.

**Attributes**

SPSR_svc is a 32-bit register.

**Field descriptions**

The SPSR_svc bit assignments are:

```
31 30 29 28 27 26 25 24 23 21 20 19 16 15 10 9 8 7 6 5 4 3 0
| N | Z | C | V | Q | J | RES0 | IL | GE | IT[7:2] | E | A | I | F | T | M[3:0] |
```

- **N**, bit [31]
  Set to the value of CPSR.N on taking an exception to Supervisor mode, and copied to CPSR.N on executing an exception return operation in Supervisor mode.

- **Z**, bit [30]
  Set to the value of CPSR.Z on taking an exception to Supervisor mode, and copied to CPSR.Z on executing an exception return operation in Supervisor mode.
C, bit [29]
Set to the value of CPSR.C on taking an exception to Supervisor mode, and copied to CPSR.C on executing an exception return operation in Supervisor mode.

V, bit [28]
Set to the value of CPSR.V on taking an exception to Supervisor mode, and copied to CPSR.V on executing an exception return operation in Supervisor mode.

Q, bit [27]
Set to the value of CPSR.Q on taking an exception to Supervisor mode, and copied to CPSR.Q on executing an exception return operation in Supervisor mode.

IT[1:0], bits [26:25]
If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

J, bit [24]
RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bits [23:21]
Reserved, RES0.

IL, bit [20]
Illegal Execution State bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]
If-Then Execution State bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.
- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]
Endianness Execution State bit. Controls the load and store endianness for data accesses:
0 Little-endian operation
1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]
Asynchronous data abort mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

I, bit [7]
IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]
FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

T, bit [5]
T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
0 Taken from A32 state.
1 Taken from T32 state.

M[4], bit [4]
Execution state that the exception was taken from. Possible values of this bit are:
1 Exception taken from AArch32.

M[3:0], bits [3:0]
AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>User</td>

</tbody>
</table>
G6.2.125  **SPSR_und, Saved Program Status Register (Undefined mode)**

The SPSR_und characteristics are:

**Purpose**
Holds the saved process state when an exception is taken to Undefined mode.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS, !UND)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>

</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

This register is only accessible at EL1 in modes other than Undefined mode. In Undefined mode, it is accessible as the current SPSR.

**Traps and Enables**
There are no traps or enables affecting this register.

**Configurations**
There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register SPSR_und is architecturally mapped to AArch64 System register SPSR_und.

**Attributes**
SPSR_und is a 32-bit register.

**Field descriptions**
The SPSR_und bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 21 | 20 | 19 | 16 | 15 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | J  | RES0| IL | GE | IT[7:2]| E | A | I | F | T | M[3:0]|   |   |   |   |   |   |   |

**N, bit [31]**
Set to the value of CPSR.N on taking an exception to Undefined mode, and copied to CPSR.N on executing an exception return operation in Undefined mode.

**Z, bit [30]**
Set to the value of CPSR.Z on taking an exception to Undefined mode, and copied to CPSR.Z on executing an exception return operation in Undefined mode.
C, bit [29]
Set to the value of CPSR.C on taking an exception to Undefined mode, and copied to CPSR.C on executing an exception return operation in Undefined mode.

V, bit [28]
Set to the value of CPSR.V on taking an exception to Undefined mode, and copied to CPSR.V on executing an exception return operation in Undefined mode.

Q, bit [27]
Set to the value of CPSR.Q on taking an exception to Undefined mode, and copied to CPSR.Q on executing an exception return operation in Undefined mode.

IT[1:0], bits [26:25]
If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

J, bit [24]
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bits [23:21]
Reserved, RES0.

IL, bit [20]
Illegal Execution State bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]
If-Then Execution State bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.
- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]
Endianness Execution State bit. Controls the load and store endianness for data accesses:
0   Little-endian operation
1   Big-endian operation.
Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]
Asynchronous data abort mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

I, bit [7]
IRQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

F, bit [6]
FIQ mask bit. The possible values of this bit are:
0 Exception not masked.
1 Exception masked.

T, bit [5]
T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:
0 Taken from A32 state.
1 Taken from T32 state.

M[4], bit [4]
Execution state that the exception was taken from. Possible values of this bit are:
1 Exception taken from AArch32.

M[3:0], bits [3:0]
AArch32 mode that an exception was taken from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0b0110</td>
<td>Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)</td>
</tr>
<tr>
<td>0b1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved.

**Accessing the SPSR_und:**

To access the SPSR_und:

MRS <Rd>, SPSR_und ; Read SPSR_und into Rd
MSR SPSR_und, <Rd> ; Write Rd to SPSR_und
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>m</th>
<th>m1</th>
<th>R</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0110</td>
<td>1</td>
</tr>
</tbody>
</table>
G6.2.126  TCMTR, TCM Type Register

The TCMTR characteristics are:

**Purpose**

Provides information about the implementation of the TCM.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID1==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID1==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

TCMTR is a 32-bit register.

**Field descriptions**

The TCMTR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**Accessing the TCMTR:**

To access the TCMTR:

```
MRC p15,0,<Rt>,c0,c0,2 ; Read TCMTR into Rt
```
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0000</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.127 TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

**Purpose**

Invalidate all TLB entries for the PL1&0 translation regime, subject to the Privilege level and Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIALL on page G4-4144.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALL is a 32-bit system operation.

**Field descriptions**

The TLBIALL operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

**Performing the TLBIALL operation:**

To perform the TLBIALL operation:

MCR p15,0,<Rt>,c8,c7,0 ; TLBIALL operation, ignoring the value in Rt
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>000</td>
</tr>
</tbody>
</table>
### G6.2.128 TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

**Purpose**

Invalidate all TLB entries for the PL2 translation regime.

For details of the scope of this instruction see TLBIALLH on page G4-4145.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=0, Mon)</th>
<th>EL3 (SCR.NS=0, IMon)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO-UNPREDICTABLE</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see Hyp mode TLB maintenance instructions on page J1-5438.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALLH is a 32-bit system operation.

**Field descriptions**

The TLBIALLH operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

**Performing the TLBIALLH operation:**

To perform the TLBIALLH operation:

MCR p15,4,<Rt>,c8,c7,0 ; TLBIALLH operation, ignoring the value in Rt
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0111</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.129   TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

Purpose

Invalidate all TLB entries for the PL2 translation regime, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIALLH on page G4-4145.

Usage constraints

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0, Mon)</th>
<th>EL3 (SCR.NS=0, !Mon)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO-UNPREDICTABLE</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see Hyp mode TLB maintenance instructions on page J1-5438.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T8=1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8=1, Non-secure EL1 execution of this instruction is trapped to EL2.

Configurations

There are no configuration notes.

Attributes

TLBIALLHIS is a 32-bit system operation.

Field descriptions

The TLBIALLHIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

Performing the TLBIALLHIS operation:

To perform the TLBIALLHIS operation:

MCR p15,4,<Rt>,c8,c3,0 ; TLBIALLHIS operation, ignoring the value in Rt
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0011</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.130 TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

Purpose

Invalidate all TLB entries for the PL1&0 translation regime, on all PEs in the same Inner Shareable domain, subject to the Privilege level and Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIALL on page G4-4144.

Usage constraints

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

Configurations

There are no configuration notes.

Attributes

TLBIALLIS is a 32-bit system operation.

Field descriptions

The TLBIALLIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

Performing the TLBIALLIS operation:

To perform the TLBIALLIS operation:

```
MCR p15,0,<Rt>,c8,c3,0 ; TLBIALLIS operation, ignoring the value in Rt
```
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.131 TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLNSNH characteristics are:

**Purpose**

Invalidate all TLB entries for the Non-secure PL1&0 translation regime.

For details of the scope of this instruction see TLBIALLNSNH on page G4-4144.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL0</th>
<th>EL1</th>
<th>EL2</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0, Mon)</th>
<th>EL3 (SCR.NS=0, IMon)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO-UNPREDICTABLE</td>
<td></td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see Hyp mode TLB maintenance instructions on page J1-5438.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALLNSNH is a 32-bit system operation.

**Field descriptions**

The TLBIALLNSNH operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

**Performing the TLBIALLNSNH operation:**

To perform the TLBIALLNSNH operation:

MCR p15,4,<Rt>,c8,c7,4 ; TLBIALLNSNH operation, ignoring the value in Rt
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0111</td>
<td>100</td>
</tr>
</tbody>
</table>
G6.2.132 TLBIALLNSNHIS, TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable

The TLBIALLNSNHIS characteristics are:

**Purpose**

Invalidate all TLB entries for the Non-secure PL1&0 translation regime, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIALLNSNH on page G4-4144.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0, Mon)</th>
<th>EL3 (SCR.NS=0, IMon)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO-UNPREDICTABLE</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see Hyp mode TLB maintenance instructions on page J1-5438.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALLNSNHIS is a 32-bit system operation.

**Field descriptions**

The TLBIALLNSNHIS operation ignores the value in the register specified by the instruction used to perform this operation. Software does not have to write a value to the register before issuing this instruction.

**Performing the TLBIALLNSNHIS operation:**

To perform the TLBIALLNSNHIS operation:

MCR p15,4,<Rt>,c8,c3,4 ; TLBIALLNSNHIS operation, ignoring the value in Rt
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0011</td>
<td>100</td>
</tr>
</tbody>
</table>
G6.2.133 TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime that match the given ASID, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIASID on page G4-4144.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIASID is a 32-bit system operation.

**Field descriptions**

The TLBIASID input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ASID</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Reserved, RES0.
ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

Performing the TLBIASID operation:

To perform the TLBIASID operation:

```
MCR p15,0,<Rt>,c8,c7,2 ; TLBIASID operation
```

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.134   TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate TLB entries for stage 1 of the PL1&0 translation regime that match the given ASID, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIASID on page G4-4144.

Usage constraints

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

Configurations

There are no configuration notes.

Attributes

TLBIASIDIS is a 32-bit system operation.

Field descriptions

The TLBIASIDIS input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ASID</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

Performing the TLBIASIDIS operation:

To perform the TLBIASIDIS operation:

\[ \text{MCR p15,0,<Rt>,c8,c3,2 ; TLBIASIDIS operation} \]

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.135 TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

**Purpose**

Invalidate TLB entries for stage 2 of the Non-secure PL1&0 translation regime that match the given IPA and the current VMID.

For details of the scope of this instruction see TLBIIPAS2 on page G4-4145.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

This instruction is a NOP when executed in Monitor mode with SCR.NS==0, and is UNPREDICTABLE when executed in any AArch32 Secure privileged mode other than Monitor mode. This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR.EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIIPAS2 is a 32-bit system operation.

**Field descriptions**

The TLBIIPAS2 input value bit assignments are:

<table>
<thead>
<tr>
<th>31 28 27 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.
IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

**Performing the TLBIIPAS2 operation:**

To perform the TLBIIPAS2 operation:

MCR p15,4,<Rt>,c8,c4,1 ; TLBIIPAS2 operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0100</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.136 TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable

The TLBIIPAS2IS characteristics are:

**Purpose**

Invalidate TLB entries for stage 2 of the Non-secure PL1&0 translation regime that match the given IPA and the current VMID, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see **TLBIIPAS2** on page G4-4145.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

This instruction is a NOP when executed in Monitor mode with SCR.NS==0, and is UNPREDICTABLE when executed in any AArch32 Secure privileged mode other than Monitor mode.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see **Synchronous exception prioritization for exceptions taken to AArch32 state** on page G1-3845 for exceptions taken to AArch32 state, and **Synchronous exception prioritization** on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIIPAS2IS is a 32-bit system operation.

**Field descriptions**

The TLBIIPAS2IS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:28]</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
<tr>
<td>IPA[39:12]</td>
</tr>
</tbody>
</table>

Reserved, RES0.
IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

**Performing the TLBIIPAS2IS operation:**

To perform the TLBIIPAS2IS operation:

MCR p15,4,<<Rt>>,c8,c0,1 ; TLBIIPAS2IS operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.137  TLBIIPAS2L, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level

The TLBIIPAS2L characteristics are:

**Purpose**

Invalidate TLB entries for stage 2 of the Non-secure PL1&0 translation regime, for the last level of translation, that match the given IPA and the current VMID.

For details of the scope of this instruction see TLBIIPAS2 on page G4-4145.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

This instruction is a NOP when executed in Monitor mode with SCR.NS==0, and is UNPREDICTABLE when executed in any AArch32 Secure privileged mode other than Monitor mode.

This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIIPAS2L is a 32-bit system operation.

**Field descriptions**

The TLBIIPAS2L input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

IPA[39:12]

**Bits [31:28]**

Reserved, RES0.
IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Performing the TLBIIPAS2L operation:

To perform the TLBIIPAS2L operation:

MCR p15,4,<Rt>,c8,c4,5 ; TLBIIPAS2L operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0100</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.2.138  TLBIIPAS2LIS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable

The TLBIIPAS2LIS characteristics are:

**Purpose**

Invalidate TLB entries for stage 2 of the Non-secure PL1&0 translation regime, for the last level of translation, that match the given IPA and the current VMID, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIIPAS2L on page G4-4145.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

This instruction is a NOP when executed in Monitor mode with SCR.NS==0, and is UNPREDICTABLE when executed in any AArch32 Secure privileged mode other than Monitor mode. This instruction must apply to structures that contain only stage 2 translation information, but does not need to apply to structures that contain combined stage 1 and stage 2 translation information.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIIPAS2LIS is a 32-bit system operation.

**Field descriptions**

The TLBIIPAS2LIS input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td>IPA[39:12]</td>
<td></td>
</tr>
</tbody>
</table>
Bits [31:28]
   Reserved, RES0.

IPA[39:12], bits [27:0]
   Bits[39:12] of the intermediate physical address to match.

**Performing the TLBIIPAS2LIS operation:**

To perform the TLBIIPAS2LIS operation:

MCR p15,4,<Rt>,c8,c0,5 ; TLBIIPAS2LIS operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0000</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.2.139 TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

**Purpose**

Invalidate PL1&0 regime stage 1 and 2 TLB entries for the given VA and ASID, the current VMID, and the current Security state.

For details of the scope of this instruction see **TLBIMVA** on page G4-4144.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see **Synchronous exception prioritization for exceptions taken to AArch32 state** on page G1-3845 for exceptions taken to AArch32 state, and **Synchronous exception prioritization on page D1-1546** for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB=1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB=1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T8=1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8=1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIMVA is a 32-bit system operation.

**Field descriptions**

The TLBIMVA input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>VA</td>
<td>RES0</td>
<td>ASID</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Performing the TLBIMVA operation:

To perform the TLBIMVA operation:

MCR p15,0,<Rt>,c8,c7,1 ; TLBIMVA operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>001</td>
</tr>
</tbody>
</table>
### G6.2.140 TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for any ASID, that match the given VA, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAA on page G4-4144.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIMVAA is a 32-bit system operation.

**Field descriptions**

The TLBIMVAA input value bit assignments are:

<table>
<thead>
<tr>
<th>VA</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>12</td>
</tr>
<tr>
<td>11</td>
<td>0</td>
</tr>
</tbody>
</table>
VA, bits [31:12]
   Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

Bits [11:0]
   Reserved, RES0.

Performing the TLBIMVAA operation:

To perform the TLBIMVAA operation:
MCR p15,0,<Rt>,c8,c7,3 ; TLBIMVAA operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>011</td>
</tr>
</tbody>
</table>
G6.2.141 TLBIMVAAIS, TLB Invalidate by VA, All ASID, Inner Shareable

The TLBIMVAAIS characteristics are:

**Purpose**
Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for any ASID, that match the given VA, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see *TLBIMVAA* on page G4-4144.

**Usage constraints**
If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**
There are no configuration notes.

**Attributes**
TLBIMVAAIS is a 32-bit system operation.

**Field descriptions**
The TLBIMVAAIS input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>VA</td>
<td></td>
<td></td>
<td>RES0</td>
</tr>
</tbody>
</table>
VA, bits [31:12]  
Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

Bits [11:0]  
Reserved, RES0.

**Performing the TLBIMVAAIS operation:**

To perform the TLBIMVAAIS operation:

MCR p15, 0, <Rt>, c8, c3, 3 ; TLBIMVAAIS operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>011</td>
</tr>
</tbody>
</table>
G6.2.142 TLBIMVAAL, TLB Invalidate by VA, All ASID, Last level

The TLBIMVAAL characteristics are:

Purpose

Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for the last level of translation, for any ASID, that match the given VA, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAAL on page G4-4145.

Usage constraints

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

Configurations

This operation is not implemented in architecture versions before ARMv8.

Attributes

TLBIMVAAL is a 32-bit system operation.

Field descriptions

The TLBIMVAAL input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>12 11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>VA</td>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>
VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

**Performing the TLBIMVAAL operation:**

To perform the TLBIMVAAL operation:

MCR p15,0,<Rt>,c8,c7,7 ; TLBIMVAAL operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.2.143  TLBIMVAALIS, TLB Invalidate by VA, All ASID, Last level, Inner Shareable

The TLBIMVAALIS characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for the last level of translation, for any ASID, that match the given VA, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAAL on page G4-4145.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HISTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HISTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIMVAALIS is a 32-bit system operation.

**Field descriptions**

The TLBIMVAALIS input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>VA</td>
<td>RES0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Performing the TLBIMVAALIS operation:

To perform the TLBIMVAALIS operation:

MCR p15,0,<Rt>,c8,c3,7 ; TLBIMVAALIS operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.2.144 TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

**Purpose**

Invalidate TLB entries for the Non-secure PL2 translation regime that match the given VA.

For details of the scope of this instruction see TLBIMVAH on page G4-4145.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0, Mon)</th>
<th>EL3 (SCR.NS=0, IMon)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO-UNPREDICTABLE</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see Hyp mode TLB maintenance instructions on page J1-5438.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIMVAH is a 32-bit system operation.

**Field descriptions**

The TLBIMVAH input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>VA</td>
</tr>
<tr>
<td>12</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>RES0</td>
</tr>
</tbody>
</table>

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.
Bits [11:0]

Reserved, RES0.

Performing the TLBIMVAH operation:

To perform the TLBIMVAH operation:

MCR p15, 4, <Rt>, c8, c7, 1 ; TLBIMVAH operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0111</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.145 TLBIMVAHIS, TLB Invalidate by VA, Hyp mode, Inner Shareable

The TLBIMVAHIS characteristics are:

**Purpose**

Invalidate TLB entries for the Non-secure PL2 translation regime that match the given VA, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIMVAH on page G4-4145.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0, Mon)</th>
<th>EL3 (SCR.NS=0, !Mon)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO-UNPREDICTABLE</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see Hyp mode TLB maintenance instructions on page J1-5438.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIMVAHIS is a 32-bit system operation.

**Field descriptions**

The TLBIMVAHIS input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>VA</td>
<td>RES0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.
Bits [11:0]  
Reserved, RES0.

Performing the TLBIMVAHIS operation:

To perform the TLBIMVAHIS operation:

```
MCR p15,4,<Rt>,c8,c3,1 ; TLBIMVAHIS operation
```

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0011</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.146 TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

**Purpose**

Invalidate TLB entries for stage 1 of the PL1&0 translation regime that match the given VA and ASID, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see *TLBIMVA* on page G4-4144.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIMVAIS is a 32-bit system operation.

**Field descriptions**

The TLBIMVAIS input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>VA</td>
<td>RES0</td>
<td>ASID</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
VA, bits [31:12]
Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]
Reserved, RES0.

ASID, bits [7:0]
ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.
Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Performing the TLBIMVAIS operation:
To perform the TLBIMVAIS operation:
MCR p15,0,<Rt>,c8,c3,1 ; TLBIMVAIS operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.2.147   TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

**Purpose**

Invalidate TLB entries for the stage 1 PL1&0 translation regime, for the last level of translation, that
match the given VA and ASID, subject to the Security state at which the instruction is executed.
For details of the scope of this instruction see "TLBIMVAL on page G4-4145."

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following
exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible
as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects
TLB entries related to the Secure EL1 translation regime.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see "Synchronous exception
prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to
AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to
AArch64 state. Subject to the prioritization rules:

- If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.
- If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.
- If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
- If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIMVAL is a 32-bit system operation.

**Field descriptions**

The TLBIMVAL input value bit assignments are:

```
 31 12 11 8 7 0
  VA RES0 ASID
```
VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Performing the TLBIMVAL operation:

To perform the TLBIMVAL operation:

MCR p15,0,<Rt>,c8,c7,5 ; TLBIMVAL operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0111</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.2.148 TLBIMVALH, TLB Invalidate by VA, Last level, Hyp mode

The TLBIMVALH characteristics are:

**Purpose**
Invalidate TLB entries for the Non-secure PL2 translation regime, for the last level of translation, that match the given VA.
For details of the scope of this instruction see TLBIMVALH on page G4-4145.

**Usage constraints**
If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0, Mon)</th>
<th>EL3 (SCR.NS=0, !Mon)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO-UNPREDICTABLE</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is constrained unpredictable. For more information see Hyp mode TLB maintenance instructions on page J1-5438.

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:
If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.
If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**
This operation is not implemented in architecture versions before ARMv8.

**Attributes**
TLBIMVALH is a 32-bit system operation.

**Field descriptions**
The TLBIMVALH input value bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>VA</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>12</td>
<td>11</td>
</tr>
</tbody>
</table>

VA, bits [31:12]
Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.
Bits [11:0]

Reserved, RES0.

Performing the TLBIMVALH operation:

To perform the TLBIMVALH operation:

MCR p15,4,<Rt>,c8,c7,5 ; TLBIMVALH operation

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0111</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.2.149 TLBIMVALHIS, TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable

The TLBIMVALHIS characteristics are:

**Purpose**

Invalidate TLB entries for the Non-secure PL2 translation regime, for the last level of translation, that match the given VA, on all PEs in the same Inner Shareable domain.

For details of the scope of this instruction see TLBIMVALH on page G4-4145.

**Usage constraints**

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0, Mon)</th>
<th>EL3 (SCR.NS=0, !Mon)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO-UNPREDICTABLE</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see Hyp mode TLB maintenance instructions on page J1-5438.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HSTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

**Configurations**

This operation is not implemented in architecture versions before ARMv8.

**Attributes**

TLBIMVALHIS is a 32-bit system operation.

**Field descriptions**

The TLBIMVALHIS input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>VA</td>
<td>RES0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**VA, bits [31:12]**

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.
Bits [11:0]

Reserved, RES0.

Performing the TLBIMVALHIS operation:

To perform the TLBIMVALHIS operation:

```
MCR p15,4,<Rt>,c8,c3,5 ; TLBIMVALHIS operation
```

The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1000</td>
<td>0011</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.2.150 TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALIS characteristics are:

Purpose

Invalidate TLB entries for stage 1 of the PL1&0 translation regime, for the last level of translation, that match the given VA and ASID, on all PEs in the same Inner Shareable domain, subject to the Security state at which the instruction is executed.

For details of the scope of this instruction see TLBIMVAL on page G4-4145.

Usage constraints

If EL3 is implemented and is using AArch32, this operation can be performed at the following exception levels:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If this operation is executed at Secure EL1 in AArch32 when EL3 is using AArch64, it only affects TLB entries related to the Secure EL1 translation regime.

If this operation is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE. For more information see Hyp mode TLB maintenance instructions on page J1-5438.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TTLB==1, Non-secure PL1 execution of this instruction is trapped to Hyp mode.

If HCR_EL2.TTLB==1, Non-secure PL1 execution of this instruction is trapped to EL2.

If HISTR.T8==1, Non-secure EL1 execution of this instruction is trapped to Hyp mode.

If HISTR_EL2.T8==1, Non-secure EL1 execution of this instruction is trapped to EL2.

Configurations

This operation is not implemented in architecture versions before ARMv8.

Attributes

TLBIMVALIS is a 32-bit system operation.

Field descriptions

The TLBIMVALIS input value bit assignments are:
VA, bits [31:12]
Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]
Reserved, RES0.

ASID, bits [7:0]
ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.
Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Performing the TLBIMVALIS operation:
To perform the TLBIMVALIS operation:
MCR p15,0,<Rt>,c8,c3,5 ; TLBIMVALIS operation
The operation is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1000</td>
<td>0011</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.2.151 TLBTR, TLB Type Register

The TLBTR characteristics are:

**Purpose**

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TID1==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TID1==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HSTR.T0==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T0==1, Non-secure EL1 read accesses to this register are trapped to EL2.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

TLBTR is a 32-bit register.

**Field descriptions**

The TLBTR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>10</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td>nU</td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.
nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB:

0  Unified TLB.
1  Separate Instruction and Data TLBs.

**Accessing the TLBTR:**

To access the TLBTR:

```assembly
MRC p15,0,<Rt>,c0,c0,3 ; Read TLBTR into Rt
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>

G6.2.152  TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

**Purpose**

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register. 

TPIDRPRW(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

TPIDRPRW(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register. 

TPIDRPRW is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

The PE never updates this register. This means the register is always UNKNOWN on reset.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T13==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T13==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register TPIDRPRW is architecturally mapped to AArch64 System register TPIDR_EL1[31:0].

**Attributes**

TPIDRPRW is a 32-bit register.

**Field descriptions**

The TPIDRPRW bit assignments are:
Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

**Accessing the TPIDRPRW:**

To access the TPIDRPRW:

- MRC p15,0,<Rt>,c13,c0,4 ; Read TPIDRPRW into Rt
- MCR p15,0,<Rt>,c13,c0,4 ; Write Rt to TPIDRPRW

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>

### G6.2.155 TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

#### Purpose

Determines which of the Translation Table Base Registers defined the base address for a translation table walk required for the stage 1 translation of a memory access from any mode other than Hyp mode. Also controls the translation table format and, when using the Long-descriptor translation table format, holds cacheability and shareability information.

#### Usage constraints

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

TTBCR(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

TTBCR(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

TTBCR is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

#### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.
- If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If HCR_EL2.TVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.
- If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

#### Configurations

AArch32 System register TTBCR is architecturally mapped to AArch64 System register TCR_EL1[31:0].

The current translation table format determines which format of the register is used.

When EL3 is using AArch32, write access to TTBCR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.
Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

Attributes

TTBCR is a 32-bit register.

Field descriptions

The TTBCR bit assignments are:

For all register layouts:

EAE, bit [31]

Extended Address Enable. The meanings of the possible values of this bit are:

0 Use the VMSA\textsuperscript{v8-32} translation system with the Short-descriptor translation table format.
1 Use the VMSA\textsuperscript{v8-32} translation system with the Long-descriptor translation table format.

When TTBCR.EAE==0:

31 30 6 5 4 3 2 0

RES0 N

EAE

EAE, bit [31]

Extended Address Enable. The meanings of the possible values of this bit are:

0 Use the VMSA\textsuperscript{v8-32} translation system with the Short-descriptor translation table format.

When this register has an architecturally-defined reset value, this field resets to 0.

Bits [30:6]

Reserved, RES0.

PD1, bit [5]

Translation table walk disable for translations using TTBR\textsubscript{1}. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR\textsubscript{1}. The encoding of this bit is:

0 Perform translation table walks using TTBR\textsubscript{1}.
1 A TLB miss on an address that is translated using TTBR\textsubscript{1} generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to 0.
PD0, bit [4]

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using TTBR0. The encoding of this bit is:

0  Perform translation table walks using TTBR0.
1  A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to 0.

Bit [3]

Reserved, RES0.

N, bits [2:0]

Indicate the width of the base address held in TTBR0. In TTBR0, the base address field is bits[31:14-N]. The value of N also determines:

• Whether TTBR0 or TTBR1 is used as the base address for translation table walks.
• The size of the translation table pointed to by TTBR0.

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with ARMv5 and ARMv6.

When this register has an architecturally-defined reset value, this field resets to 0.

When TTBCR.EAE==1:

EAE, bit [31]

Extended Address Enable. The meanings of the possible values of this bit are:

1  Use the VMSA_v8-32 translation system with the Long-descriptor translation table format.

When this register has an architecturally-defined reset value, this field resets to 0.

IMP DEF, bit [30]

IMPLEMENTATION DEFINED.

When this register has an architecturally-defined reset value, this field resets to 0.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1.

00  Non-shareable
10  Outer Shareable
11  Inner Shareable

Other values are reserved.
When this register has an architecturally-defined reset value, this field resets to 0.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using \texttt{TTBR1}.

- 00 Normal memory, Outer Non-cacheable
- 01 Normal memory, Outer Write-Back Write-Allocate Cacheable
- 10 Normal memory, Outer Write-Through Cacheable
- 11 Normal memory, Outer Write-Back no Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

**IRGN1, bits [25:24]**

Inner cacheability attribute for memory associated with translation table walks using \texttt{TTBR1}.

- 00 Normal memory, Inner Non-cacheable
- 01 Normal memory, Inner Write-Back Write-Allocate Cacheable
- 10 Normal memory, Inner Write-Through Cacheable
- 11 Normal memory, Inner Write-Back no Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

**EPD1, bit [23]**

Translation table walk disable for translations using \texttt{TTBR1}. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using \texttt{TTBR1}. The encoding of this bit is:

- 0 Perform translation table walks using \texttt{TTBR1}.
- 1 A TLB miss on an address that is translated using \texttt{TTBR1} generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to 0.

**A1, bit [22]**

Selects whether \texttt{TTBR0} or \texttt{TTBR1} defines the ASID. The encoding of this bit is:

- 0 \texttt{TTBR0}.ASID defines the ASID.
- 1 \texttt{TTBR1}.ASID defines the ASID.

When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [21:19]**

Reserved, RES0.

**T1SZ, bits [18:16]**

See *Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G4-4098* for how TTBCR.\{T1SZ, T0SZ\} determine the input address ranges and memory region sizes translated using \texttt{TTBR0} and \texttt{TTBR1}.

When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [15:14]**

Reserved, RES0.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using \texttt{TTBR0}.

- 00 Non-shareable
- 10 Outer Shareable
- 11 Inner Shareable

Other values are reserved.
When this register has an architecturally-defined reset value, this field resets to 0.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>01</td>
<td>Normal memory, Outer Write-Back Write-Allocate Cacheable</td>
</tr>
<tr>
<td>10</td>
<td>Normal memory, Outer Write-Through Cacheable</td>
</tr>
<tr>
<td>11</td>
<td>Normal memory, Outer Write-Back no Write-Allocate Cacheable</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to 0.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>01</td>
<td>Normal memory, Inner Write-Back Write-Allocate Cacheable</td>
</tr>
<tr>
<td>10</td>
<td>Normal memory, Inner Write-Through Cacheable</td>
</tr>
<tr>
<td>11</td>
<td>Normal memory, Inner Write-Back no Write-Allocate Cacheable</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to 0.

**EPD0, bit [7]**

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Perform translation table walks using TTBR0.</td>
</tr>
<tr>
<td>1</td>
<td>A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [6:3]**

Reserved, RES0.

**T0SZ, bits [2:0]**

See Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G4-4098 for how TTBCR.\{T1SZ, T0SZ\} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the TTBCR:

To access the TTBCR:

MRC p15,0,<Rt>,c2,c0,2 ; Read TTBCR into Rt  
MCR p15,0,<Rt>,c2,c0,2 ; Write Rt to TTBCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0010</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.156 TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

**Purpose**

Holds the base address of translation table 0, and information about the memory it occupies. This is one of the translation tables for the stage 1 translation of memory accesses from modes other than Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

TTBR0(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

TTBR0(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

TTBR0 is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Used in conjunction with the TTBCR. When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.
If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
If HCR_EL2.TRVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.
If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.
If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register TTBR0 is architecturally mapped to AArch64 System register TTBR0_EL1.

TTBCR.EAE determines which TTBR0 format is used:

- EAE==0  32-bit format is used. TTBR0[63:32] are ignored.
- EAE==1  64-bit format is used.
When EL3 is using AArch32, write access to TTBR0(S) is disabled when the \textbf{CP15SDISABLE} signal is asserted HIGH.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

**Field descriptions**

The TTBR0 bit assignments are:

\textbf{When TTBCR.EAE==0:}

<table>
<thead>
<tr>
<th>31</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTB0</td>
<td>RGN</td>
<td>S</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**TTB0, bits [31:7]**

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

**IRGN[0], bit [6]**

See IRGN[1] below for description of the IRGN field.

**NOS, bit [5]**

Not Outer Shareable bit. Indicates the Outer Shareable attribute for the memory associated with a translation table walk that has the Shareable attribute, indicated by TTBR0.S == 1:

- 0 Outer Shareable.
- 1 Inner Shareable.

This bit is ignored when TTBR0.S == 0.

**RGN, bits [4:3]**

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

- 00 Normal memory, Outer Non-cacheable.
- 01 Normal memory, Outer Write-Back Write-Allocate Cacheable.
- 10 Normal memory, Outer Write-Through Cacheable.
- 11 Normal memory, Outer Write-Back no Write-Allocate Cacheable.
IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is UNK/SBZP.

S, bit [1]

Shareable bit. Indicates the Shareable attribute for the memory associated with the translation table walks:

- 0: Non-shareable
- 1: Shareable.

IRGN[1], bit [0]

Inner region bits. Indicates the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

- 00: Normal memory, Inner Non-cacheable.
- 01: Normal memory, Inner Write-Back Write-Allocate Cacheable.
- 10: Normal memory, Inner Write-Through Cacheable.
- 11: Normal memory, Inner Write-Back no Write-Allocate Cacheable.

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 or later without the Multiprocessing Extensions can run unmodified on an implementation that includes the Multiprocessing Extensions.

When TTBCR.EAE==1:

<table>
<thead>
<tr>
<th>63</th>
<th>56</th>
<th>55</th>
<th>48</th>
<th>47</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ASID</td>
<td>BADDR</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

BADDR, bits [47:0]

Translation table base address, bits[47:x]. Bits [x-1:0] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T0SZ as follows:

- If TTBCR.T0SZ is 0 or 1, x = 5 - TTBCR.T0SZ.
- If TTBCR.T0SZ is greater than 1, x = 14 - TTBCR.T0SZ.

If bits[47:40] of the Translation table base address are not zero, an Address size fault is generated.

Accessing the TTBR0:

To access the TTBR0 when accessing as a 32-bit register:
MRC p15,0,<Rt>,c2,c0,0 ; Read TTBR0[31:0] into Rt
MCR p15,0,<Rt>,c2,c0,0 ; Write Rt to TTBR0[31:0]. TTBR0[63:32] are unchanged

Register access is encoded as follows:

\[
\begin{array}{cccc}
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
1111 & 000 & 0010 & 0000 & 000 \\
\end{array}
\]

To access the TTBR0 when accessing as a 64-bit register:

MRRC p15,0,<Rt>,<Rt2>,c2 ; Read TTBR0[31:0] into Rt and TTBR0[63:32] into Rt2
MCRR p15,0,<Rt>,<Rt2>,c2 ; Write Rt to TTBR0[31:0] and Rt2 to TTBR0[63:32]

Register access is encoded as follows:

\[
\begin{array}{ccc}
\text{coproc} & \text{opc1} & \text{CRm} \\
1111 & 0000 & 0010 \\
\end{array}
\]
G6.2.157 TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

Purpose

Holds the base address of translation table 1, and information about the memory it occupies. This is one of the translation tables for the stage 1 translation of memory accesses from modes other than Hyp mode.

Usage constraints

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

TTBR1(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

TTBR1(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

TTBR1 is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Used in conjunction with the TTBCR. When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR1.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HCR.TVM==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.
If HCR.TRVM==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
If HCR_EL2.TRVM==1, Non-secure PL1 read accesses to this register are trapped to EL2.
If HCR_EL2.TVM==1, Non-secure PL1 write accesses to this register are trapped to EL2.
If HISTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
If HISTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

Configurations

AArch32 System register TTBR1 is architecturally mapped to AArch64 System register TTBR1_EL1.

TTBCR.EAE determines which TTBR1 format is used:

EAE=0 32-bit format is used. TTBR1[63:32] are ignored.
EAE=1 64-bit format is used.
RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

Field descriptions

The TTBR1 bit assignments are:

When TTBCR.EAE==0:

<table>
<thead>
<tr>
<th>31</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTB1</td>
<td>RGN</td>
<td>S</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

IRGN[0], bit [6]

See IRGN[1] below for description of the IRGN field.

NOS, bit [5]

Not Outer Shareable bit. Indicates the Outer Shareable attribute for the memory associated with a translation table walk that has the Shareable attribute, indicated by TTBR0.S == 1:

0 Outer Shareable.
1 Inner Shareable.

This bit is ignored when TTBR0.S == 0.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

00 Normal memory, Outer Non-cacheable.
01 Normal memory, Outer Write-Back Write-Allocate Cacheable.
10 Normal memory, Outer Write-Through Cacheable.
11 Normal memory, Outer Write-Back no Write-Allocate Cacheable.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is UNK/SBZP.
S, bit [1]
Shareable bit. Indicates the Shareable attribute for the memory associated with the translation table walks:

0  Non-shareable
1  Shareable.

IRGN[1], bit [0]
Inner region bits. Indicates the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

00  Normal memory, Inner Non-cacheable.
01  Normal memory, Inner Write-Back Write-Allocate Cacheable.
10  Normal memory, Inner Write-Through Cacheable.
11  Normal memory, Inner Write-Back no Write-Allocate Cacheable.

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 or later without the Multiprocessing Extensions can run unmodified on an implementation that includes the Multiprocessing Extensions.

When TTBCR.EAE==1:

Bits [63:56]
Reserved, RES0.

ASID, bits [55:48]
An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

BADDR, bits [47:0]
Translation table base address, bits[47:x], Bits [x-1:0] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T1SZ as follows:

- If TTBCR.T1SZ is 0 or 1, x = 5 - TTBCR.T1SZ.
- If TTBCR.T1SZ is greater than 1, x = 14 - TTBCR.T1SZ.

If bits[47:40] of the Translation table base address are not zero, an Address size fault is generated.

Accessing the TTBR1:

To access the TTBR1 when accessing as a 32-bit register:

MRC p15,0,<Rt>,c2,c0,1 ; Read TTBR1[31:0] into Rt
MCR p15,0,<Rt>,c2,c0,1 ; Write Rt to TTBR1[31:0]. TTBR1[63:32] are unchanged
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0010</td>
<td>0000</td>
<td>001</td>
</tr>
</tbody>
</table>

To access the TTBR1 when accessing as a 64-bit register:

MRRC p15,1,<Rt>,<Rt2>,c2 ; Read TTBR1[31:0] into Rt and TTBR1[63:32] into Rt2
MCRR p15,1,<Rt>,<Rt2>,c2 ; Write Rt to TTBR1[31:0] and Rt2 to TTBR1[63:32]

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0001</td>
<td>0010</td>
</tr>
</tbody>
</table>
G6.2.158  VBAR, Vector Base Address Register

The VBAR characteristics are:

**Purpose**

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

VBAR(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

VBAR(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

VBAR is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HISTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HISTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register VBAR is architecturally mapped to AArch64 System register VBAR_EL1[31:0].

When EL3 is using AArch32, write access to VBAR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

VBAR is a 32-bit register.
Field descriptions

The VBAR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:5]</td>
<td>Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset. When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED value, that might be UNKNOWN.</td>
</tr>
<tr>
<td>Bits [4:0]</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

Accessing the VBAR:

To access the VBAR:

MRC p15,0,<Rt>,c12,c0,0 ; Read VBAR into Rt
MCR p15,0,<Rt>,c12,c0,0 ; Write Rt to VBAR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of MPIDR.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T0==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T0==1, Non-secure EL1 accesses to this register are trapped to EL2.

Configurations

AArch32 System register VMPIDR is architecturally mapped to AArch64 System register VMPIDR_EL2[31:0].

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MPIDR. Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

VMPIDR is a 32-bit register.

Field descriptions

The VMPIDR bit assignments are:
M, bit [31]
Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:
0 This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
1 This implementation includes the ARMv7 Multiprocessing Extensions functionality.
In ARMv8 this bit is RES1.

U, bit [30]
Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:
0 Processor is part of a multiprocessor system.
1 Processor is part of a uniprocessor system.
When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.U.

Bits [29:25]
Reserved, RES0.

MT, bit [24]
Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach. The possible values of this bit are:
0 Performance of PEs at the lowest affinity level is largely independent.
1 Performance of PEs at the lowest affinity level is very interdependent.
When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.MT.

Aff2, bits [23:16]
Affinity level 2. The least significant affinity level field, for this PE in the system.
When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.Aff2.

Aff1, bits [15:8]
Affinity level 1. The intermediate affinity level field, for this PE in the system.
When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.Aff1.

Aff0, bits [7:0]
Affinity level 0. The most significant affinity level field, for this PE in the system.
When this register has an architecturally-defined reset value, this field resets to the value of MPIDR.Aff0.

Accessing the VMPIDR:
To access the VMPIDR:
MRC p15,4,<Rt>,c0,c0,5 ; Read VMPIDR into Rt
MCR p15,4,<Rt>,c0,c0,5 ; Write Rt to VMPIDR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>0000</td>
<td>0000</td>
<td>101</td>
</tr>
</tbody>
</table>
## G6.2.160 VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

**Purpose**

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of MIDR.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If $\text{HISTR.T0}==1$, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If $\text{HISTR_EL2.T0}==1$, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register VPIDR is architecturally mapped to AArch64 System register VPIDR_EL2.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MIDR.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

VPIDR is a 32-bit register.

**Field descriptions**

The VPIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>24 23</th>
<th>20 19</th>
<th>16 15</th>
<th>4 3 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementer</td>
<td>Variant</td>
<td>PartNum</td>
<td>Revision</td>
<td></td>
</tr>
</tbody>
</table>
Implementer, bits [31:24]
The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td>ARM Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>B</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>C</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>D</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x49</td>
<td>I</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x4D</td>
<td>M</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>N</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>P</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Q</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>V</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>i</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.Implementer.

Variant, bits [23:20]
An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.Variant.

Architecture, bits [19:16]
The permitted values of this field are:

0001   ARMv4
0100   ARMv5T
0011   ARMv5 (obsolete)
0101   ARMv5TE
0110   ARMv5TEJ
0111   ARMv6
1111   Architectural features are individually identified in the ID_* registers, see Identification registers, functional group on page G4-4232.

All other values are reserved.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.Architecture.

PartNum, bits [15:4]
An IMPLEMENTATION DEFINED primary part number for the device.
On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.PartNum.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

When this register has an architecturally-defined reset value, this field resets to the value of MIDR.Revision.

**Accessing the VPIDR:**

To access the VPIDR:

```
MRC p15,4,<Rt>,c0,c0,0 ; Read VPIDR into Rt
MCR p15,4,<Rt>,c0,c0,0 ; Write Rt to VPIDR
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>0000</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.2.161 VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

**Purpose**

Controls the translation table walks required for the stage 2 translation of memory accesses from Non-secure modes other than Hyp mode, and holds cacheability and shareability information for the accesses.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

Used in conjunction with VTTBR, that defines the translation table base address for the translations.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T2=1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HISTR_EL2.T2=1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register VTCR is architecturally mapped to AArch64 System register VTCR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

VTCR is a 32-bit register.

**Field descriptions**

The VTCR bit assignments are:
Bit [31]
Reserved, RES1.

Bits [30:14]
Reserved, RES0.

SH0, bits [13:12]
Shareability attribute for memory associated with translation table walks using VTTBR.
00 Non-shareable
10 Outer Shareable
11 Inner Shareable
Other values are reserved.

ORGN0, bits [11:10]
Outer cacheability attribute for memory associated with translation table walks using VTTBR.
00 Normal memory, Outer Non-cacheable
01 Normal memory, Outer Write-Back Write-Allocate Cacheable
10 Normal memory, Outer Write-Through Cacheable
11 Normal memory, Outer Write-Back no Write-Allocate Cacheable

IRGN0, bits [9:8]
Inner cacheability attribute for memory associated with translation table walks using VTTBR.
00 Normal memory, Inner Non-cacheable
01 Normal memory, Inner Write-Back Write-Allocate Cacheable
10 Normal memory, Inner Write-Through Cacheable
11 Normal memory, Inner Write-Back no Write-Allocate Cacheable

SL0, bits [7:6]
Starting level for translation table walks using VTTBR.
00 Start at second level
01 Start at first level
Other values are reserved.
If the stage 2 input address size, as programmed in VTCR.T0SZ, is out of range with respect to the starting level at the time of a translation walk that uses the stage 2 translation, then a second stage level 1 translation fault is generated.

Bit [5]
Reserved, RES0.

S, bit [4]
Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the stage 2 T0SZ value is treated as an UNKNOWN value.

T0SZ, bits [3:0]
The size offset of the memory region addressed by VTTBR. The region size is $2^{(32-T0SZ)}$ bytes. This field holds a four-bit signed integer value, meaning it supports values from -8 to 7. This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

**Accessing the VTCR:**

To access the VTCR:
MRC p15,4,<Rt>,c2,c1,2 ; Read VTCR into Rt
MCR p15,4,<Rt>,c2,c1,2 ; Write Rt to VTCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>0010</td>
<td>0001</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.2.162 VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the stage 2 translation of memory accesses from Non-secure modes other than Hyp mode.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

Used in conjunction with the VTCR.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchromous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchromous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T2==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T2==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

AArch32 System register VTTBR is architecturally mapped to AArch64 System register VTTBR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

VTTBR is a 64-bit register.

**Field descriptions**

The VTTBR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:56]</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
<tr>
<td>VMID</td>
</tr>
<tr>
<td>BADDR</td>
</tr>
</tbody>
</table>

Reserved, RES0.
VMID, bits [55:48]

The VMID for the translation table.

When this register has an architecturally-defined reset value, this field resets to 0.

BADDR, bits [47:0]

Translation table base address, bits[47:x], Bits [x-1:0] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned Translation Table Base Address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of VTCR.T0SZ as follows:

- If VTCR.T0SZ is 0 or 1, x = 5 - VTCR.T0SZ.
- If VTCR.T0SZ is greater than 1, x = 14 - VTCR.T0SZ.

If bits[47:40] of the Translation table base address are not zero, an Address size fault is generated.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

Accessing the VTTBR:

To access the VTTBR:

MRRC p15,6,<Rt>,<Rt2>,c2 ; Read VTTBR[31:0] into Rt and VTTBR[63:32] into Rt2
MCRR p15,6,<Rt>,<Rt2>,c2 ; Write Rt to VTTBR[31:0] and Rt2 to VTTBR[63:32]

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0110</td>
<td>0010</td>
</tr>
</tbody>
</table>
G6.3 Debug registers

This section lists the Debug registers in AArch32.
G6.3.1 DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register DBGAUTHSTATUS is architecturally mapped to AArch64 System register **DBGAUTHSTATUS_EL1**.
- AArch32 System register DBGAUTHSTATUS is architecturally mapped to External register **DBGAUTHSTATUS_EL1**.

This register is required in all implementations.

**Attributes**

DBGAUTHSTATUS is a 32-bit register.

**Field descriptions**

The DBGAUTHSTATUS bit assignments are:

```
31 8 7 6 5 4 3 2 1 0

RES0  SNID  SID  NSID  NSNID
```
Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

Secure non-invasive debug. Possible values of this field are:

00  Not implemented. EL3 is not implemented and the implemented Security state is Non-Secure state.
10  Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
11  Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

00  Not implemented. EL3 is not implemented and the implemented Security state is Non-Secure state.
10  Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
11  Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

Other values are reserved.

NSNID, bits [3:2]

Non-secure non-invasive debug. Possible values of this field are:

00  Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
10  Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
11  Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

00  Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
10  Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
11  Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

Other values are reserved.

Accessing the DBGAUTHSTATUS:

To access the DBGAUTHSTATUS:

MRC p14, 0, <Rt>, c7, c14, 6 ; Read DBGAUTHSTATUS into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0111</td>
<td>1110</td>
<td>110</td>
</tr>
</tbody>
</table>
### DBGBCR<\(n\)>, Debug Breakpoint Control Registers, \(n = 0 - 15\)

The DBGBCR<\(n\)> characteristics are:

#### Purpose

Holds control information for a breakpoint. Forms breakpoint \(n\) together with value register DBGBVR<\(n\)> where \(n\) is 0 to 15. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<\(n\)> can be associated with a Breakpoint Extended Value Register DBGBXVR<\(n\)> for VMID matching.

#### Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

When the E field is zero, all the other fields in the register are ignored.

#### Traps and Enables

For a description of the prioritization of any generated exceptions, see:

- **Synchronous exception prioritization for exceptions taken to AArch32 state** on page G1-3845 for exceptions taken to AArch32 state.
- **Synchronous exception prioritization** on page D1-1546 for exceptions taken to AArch64 state.
- **Software Access debug event** on page H3-5037 for accesses to this register trapped to Debug state.

Subject to the prioritization rules:

- If EDSCR.TDA==1, and OSLSR.OSLK==0, PL1 and PL2 accesses to this register are trapped to Debug state.
- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGBCR<\(n\)> is architecturally mapped to AArch64 System register DBGBCR<\(n\>_EL1.

AArch32 System register DBGBCR<\(n\)> is architecturally mapped to External register DBGBCR<\(n\>_EL1.

#### Attributes

DBGBCR<\(n\)> is a 32-bit register.

#### Field descriptions

The DBGBCR<\(n\)> bit assignments are:
Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

- 0000: Unlinked instruction address match.
- 0001: Linked instruction address match.
- 0010: Unlinked context ID match.
- 0011: Linked context ID match.
- 0100: Unlinked instruction address mismatch.
- 0101: Linked instruction address mismatch.
- 1000: Unlinked VMID match.
- 1001: Linked VMID match.
- 1010: Unlinked VMID and context ID match.
- 1011: Linked VMID and context ID match.

The field breaks down as follows:

- BT[3:1]: Base type.
  - 000: Match address. DBGBVR<\text{n}> is the address of an instruction.
  - 010: Mismatch address. Behaves as type 000 if in an AArch64 translation, or if Halting debug is enabled and halting is allowed. Otherwise, DBGBVR<\text{n}> is the address of an instruction to be stepped.
  - 001: Match context ID. DBGBVR<\text{n}> is a context ID.
  - 100: Match VMID. DBGBXVR<\text{n}>[7:0] is a VMID.
  - 101: Match VMID and context ID. DBGBVR<\text{n}> is a context ID, and DBGBXVR<\text{n}>[7:0] is a VMID.

- BT[0]: Enable linking.

If the breakpoint is not context-aware, BT[3] and BT[1] are RES0. If EL2 is not implemented, BT[3] is RES0. If EL1 using AArch32 is not implemented, BT[2] is RES0.

The values 011x and 11xx are reserved, but must behave as if the breakpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.
SSC, bits [15:14]
Security state control. Determines the Security states under which a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Cold reset.

HMC, bit [13]
Higher mode control. Determines the debug perspective for deciding when a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Cold reset.

Bits [12:9]
Reserved, RES0.

BAS, bits [8:5]
Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64-only implementation, this field is reserved, RES1. Otherwise:
• BAS[2] and BAS[0] are read/write.
• BAS[3] and BAS[1] are read-only copies of BAS[2] and BAS[0] respectively.
The values 0011 and 1100 are only supported if AArch32 is supported at any Exception level.
The permitted values depend on the breakpoint type.
For Address match breakpoints:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0011</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for T32 instructions.</td>
</tr>
<tr>
<td>1100</td>
<td>DBGBVR&lt;n&gt;+2</td>
<td>Use for T32 instructions.</td>
</tr>
<tr>
<td>1111</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for A32 instructions.</td>
</tr>
</tbody>
</table>

0000 is reserved and must behave as if the breakpoint is disabled or map to a permitted value.
For Address mismatch breakpoints in an AArch32 stage 1 translation regime:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Step instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>-</td>
<td>Use for a match anywhere breakpoint.</td>
</tr>
<tr>
<td>0011</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for stepping T32 instructions.</td>
</tr>
<tr>
<td>1100</td>
<td>DBGBVR&lt;n&gt;+2</td>
<td>Use for stepping T32 instructions.</td>
</tr>
<tr>
<td>1111</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for stepping A32 instructions.</td>
</tr>
</tbody>
</table>

For Context matching breakpoints, this field is RES1 and ignored.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Cold reset.
Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

E, bit [0]

Enable breakpoint DBGBVR<n>. Possible values are:

0 Breakpoint disabled.
1 Breakpoint enabled.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

Accessing the DBGBCR<n>:

To access the DBGBCR<n>:

MRC p14,0,<Rt>,c0,<CRm>,5 ; Read DBGBCR<n> into Rt, where n is in the range 0 to 15
MCR p14,0,<Rt>,c0,<CRm>,5 ; Write Rt to DBGBCR<n>, where n is in the range 0 to 15

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>n&lt;3:0&gt;</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.3.3   DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register DBGBCR<n>, where n is 0 to 15. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Some breakpoints might not support Context ID comparison. For more information, see the description of the DBGDIRD.CTX_CMPs field.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see:
- Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state.
- Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state.
- Software Access debug event on page H3-5037 for accesses to this register trapped to Debug state.

Subject to the prioritization rules:
- If EDSCR.TDA==1, and OSLSR.OSLK==0, PL1 and PL2 accesses to this register are trapped to Debug state.
- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.
- AArch32 System register DBGBVR<n> is architecturally mapped to AArch64 System register DBGBVR<n>_EL1[31:0].
- AArch32 System register DBGBVR<n> is architecturally mapped to External register DBGBVR<n>_EL1[31:0].

**Attributes**

DBGBVR<n> is a 32-bit register.
Field descriptions

The DBGBVR<n> bit assignments are:

**When DBGBCR<n>.BT==0b0x0x:**

![Diagram](image)

VA[31:2], bits [31:2]

Bits[31:2] of the address value for comparison.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

Bits [1:0]

Reserved, RES0.

**When DBGBCR<n>.BT==0b1x0x:**

![Diagram](image)

Bits [31:0]

Reserved, RES0.

**When DBGBCR<n>.BT==0xxx1x:**

![Diagram](image)

ContextID, bits [31:0]

Context ID value for comparison.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Accessing the DBGBVR<n>:**

To access the DBGBVR<n>:

MRC p14,0,<Rt>,c0,<CRm>,4 ; Read DBGBVR<n> into Rt, where n is in the range 0 to 15
MCR p14,0,<Rt>,c0,<CRm>,4 ; Write Rt to DBGBVR<n>, where n is in the range 0 to 15
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>n&lt;3:0&gt;</td>
<td>100</td>
</tr>
</tbody>
</table>
### G6.3.4 DBGBXVR<\(n\)>, Debug Breakpoint Extended Value Registers, \(n = 0 - 15\)

The DBGBXVR<\(n\)> characteristics are:

**Purpose**
Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register DBGBCR<\(n\)> and a value register DBGBVR<\(n\)> where \(n\) is 0 to 15. Used if EL2 is implemented and breakpoint \(n\) supports Context matching.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see:
- *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state.
- *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state.
- *Software Access debug event on page H3-5037* for accesses to this register trapped to Debug state.

Subject to the prioritization rules:
If EDSCR.TDA==1, and OSLSR.OSLK==0, PL1 and PL2 accesses to this register are trapped to Debug state.
If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**
There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register DBGBXVR<\(n\)> is architecturally mapped to AArch64 System register DBGBVR<\(n\)> EL1[63:32].
AArch32 System register DBGBXVR<\(n\)> is architecturally mapped to External register DBGBVR<\(n\)> EL1[63:32].

**Attributes**
DBGBXVR<\(n\)> is a 32-bit register.

**Field descriptions**
The DBGBXVR<\(n\)> bit assignments are:
When DBGBCR\<n\>.BT\[1\]=0b0xxx:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:0]
Reserved, RES0.

When DBGBCR\<n\>.BT\[1\]=0b1xxx and EL2 implemented:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>VMID</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]
Reserved, RES0.

VMID, bits [7:0]
VMID value for comparison.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Cold reset.

Accessing the DBGBXVR\<n\>: 

To access the DBGBXVR\<n\>:

MRC p14,0,<Rt>,c1,<CRm>,1 ; Read DBGBXVR\<n\> into Rt, where \(n\) is in the range 0 to 15
MCR p14,0,<Rt>,c1,<CRm>,1 ; Write Rt to DBGBXVR\<n\>, where \(n\) is in the range 0 to 15

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>

<td>001</td>
<td>(n&lt;3:0&gt;)</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.3.5 DBGCLAIMCLR, Debug Claim Tag Clear register

The DBGCLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM bits, and to clear these bits to 0.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

The architecture does not define any functionality for the CLAIM bits.

Used in conjunction with the DBGCLAIMSET register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register DBGCLAIMCLR is architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1.
- AArch32 System register DBGCLAIMCLR is architecturally mapped to External register DBGCLAIMCLR_EL1.

This register is required in all implementations. An implementation must include 8 CLAIM tag bits.

**Attributes**

DBGCLAIMCLR is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ/SBZ</td>
<td>CLAIM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Bits [31:8]
Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]
Claim clear bits. Reading this field returns the current value of the CLAIM bits.
Writing a 1 to one of these bits clears the corresponding CLAIM bit to 0. This is an indirect write to the CLAIM bits.
A single write operation can clear multiple bits to 0. Writing 0 to one of these bits has no effect.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Cold reset.

Accessing the DBGCLAIMCLR:
To access the DBGCLAIMCLR:
MRC p14,0,<Rt>,c7,c9,6 ; Read DBGCLAIMCLR into Rt
MCR p14,0,<Rt>,c7,c9,6 ; Write Rt to DBGCLAIMCLR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0111</td>
<td>1001</td>
<td>110</td>
</tr>
</tbody>
</table>
G6.3.6  DBGCLAIMSET, Debug Claim Tag Set register

The DBGCLAIMSET characteristics are:

**Purpose**

Used by software to set CLAIM bits to 1.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

The architecture does not define any functionality for the CLAIM bits.

Used in conjunction with the DBGCLAIMCLR register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register DBGCLAIMSET is architecturally mapped to AArch64 System register DBGCLAIMSET_EL1.
- AArch32 System register DBGCLAIMSET is architecturally mapped to External register DBGCLAIMSET_EL1.

This register is required in all implementations. An implementation must include 8 CLAIM tag bits.

**Attributes**

DBGCLAIMSET is a 32-bit register.

**Field descriptions**

The DBGCLAIMSET bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ/SBZ</td>
<td>CLAIM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Claim set bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM bit to 1. This is an indirect write to the CLAIM bits.

A single write operation can set multiple bits to 1. Writing 0 to one of these bits has no effect.

**Accessing the DBGCLAIMSET:**

To access the DBGCLAIMSET:

MRC p14,0,<Rt>,c7,c8,6 ; Read DBGCLAIMSET into Rt
MCR p14,0,<Rt>,c7,c8,6 ; Write Rt to DBGCLAIMSET

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0111</td>
<td>1000</td>
<td>110</td>
</tr>
</tbody>
</table>
G6.3.7 DBGDCCINT, DCC Interrupt Enable Register

The DBGDCCINT characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDCCINT is architecturally mapped to AArch64 System register MDCCINT_EL1.

**Attributes**

DBGDCCINT is a 32-bit register.

**Field descriptions**

The DBGDCCINT bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>TX</td>
</tr>
<tr>
<td>29</td>
<td>RX</td>
</tr>
<tr>
<td>28</td>
<td>0</td>
</tr>
</tbody>
</table>

RES0 is Reserved, RES0.
RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

0 No interrupt request generated by DTRRX.
1 Interrupt request will be generated on RXfull == 1.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

0 No interrupt request generated by DTRTX.
1 Interrupt request will be generated on TXfull == 0.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

Bits [28:0]

Reserved, RES0.

Accessing the DBGDCCINT:

To access the DBGDCCINT:

MRC p14,0,<Rt>,c0,c2,0 ; Read DBGDCCINT into Rt
MCR p14,0,<Rt>,c0,c2,0 ; Write Rt to DBGDCCINT

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.3.8 DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

Purpose

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HPCR.TDA==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.

If MPCR_EL2.TDA==1, Non-secure PL1 read accesses to this register are trapped to EL2.

If MPCR_EL3.TDA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

This register is required in all implementations.

Attributes

DBGDEVID is a 32-bit register.

Field descriptions

The DBGDEVID bit assignments are:
CIDMask, bits [31:28]
Indicates the level of support for the Context ID matching breakpoint masking capability. Permitted values of this field are:
0000  Context ID masking is not implemented.
0001  Context ID masking is implemented.
All other values are reserved. The value of this for ARMv8 is 0000.

AuxRegs, bits [27:24]
Indicates support for Auxiliary registers. Permitted values for this field are:
0000  None supported.
0001  Support for External Debug Auxiliary Control Register, EDACR.
All other values are reserved.

DoubleLock, bits [23:20]
Indicates the presence of the DBGOSDLR, OS Double Lock Register. Permitted values of this field are:
0000  The DBGOSDLR is not present.
0001  The DBGOSDLR is present.
All other values are reserved. The value of this for ARMv8 is 0001.

VirtExtns, bits [19:16]
Indicates whether EL2 is implemented. Permitted values of this field are:
0000  EL2 is not implemented.
0001  EL2 is implemented.
All other values are reserved.

VectorCatch, bits [15:12]
Defines the form of Vector catch debug event implemented. Permitted values of this field are:
0000  Address matching vector catch debug event implemented.
0001  Exception matching vector catch debug event implemented.
All other values are reserved.

BPAddrMask, bits [11:8]
Indicates the level of support for the IVA matching breakpoint masking capability. Permitted values of this field are:
0000  Breakpoint address masking may be implemented. If not implemented, DBGBCR<n>[28:24] is RAZ/WI.
0001  Breakpoint address masking is implemented.
1111  Breakpoint address masking is not implemented. DBGBCR<n>[28:24] is RES0.
All other values are reserved. The value of this for ARMv8 is 1111.

WPAddrMask, bits [7:4]
Indicates the level of support for the data VA matching watchpoint masking capability. Permitted values of this field are:
0000  Watchpoint address masking may be implemented. If not implemented, DBGWCR<n>.MASK is RAZ/WI.
0001  Watchpoint address masking is implemented.
1111  Watchpoint address masking is not implemented. DBGWCR<n>.MASK is RES0.
All other values are reserved. The value of this for ARMv8 is 0001.
PCSample, bits [3:0]
Indicates the level of Sample-based profiling support using external debug registers 40 through 43. Permitted values of this field in ARMv8 are:

- **0000**: Architecture-defined form of Sample-based profiling not implemented.
- **0010**: EDPCSR and EDCIDSR are implemented (only permitted if EL3 and EL2 are not implemented).
- **0011**: EDPCSR, EDCIDSR, and EDVIDSR are implemented.
All other values are reserved.

Accessing the DBGDEVID:
To access the DBGDEVID:

```
MRC p14,0,<Rt>,c7,c2,7 ; Read DBGDEVID into Rt
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>011</td>
<td>0010</td>
<td>11</td>
</tr>
</tbody>
</table>
### G6.3.9  DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

#### Purpose

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

#### Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

#### Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states. This register is required in all implementations.

#### Attributes

DBGDEVID1 is a 32-bit register.

#### Field descriptions

The DBGDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-4</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>4</td>
<td>PCSROffset</td>
</tr>
</tbody>
</table>

#### Bits [31:4]

Reserved, RES0.

#### PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in ARMv8 are:

- 0000  EDPCSR not implemented.
In ARMv7, this field being 0000 can also mean that EDPCSR is implemented and that values returned by reads have an offset applied and indicate the instruction set state. This is not a permitted implementation for ARMv8.

0010 EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

**Accessing the DBGDEVID1:**

To access the DBGDEVID1:

MRC p14, 0, <Rt>, c7, c1, 7 ; Read DBGDEVID1 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0111</td>
<td>0001</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.3.10  DBGDEVID2, Debug Device ID register 2

The DBGDEVID2 characteristics are:

**Purpose**

Reserved for future descriptions of features of the debug implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

DBGDEVID2 is a 32-bit register.

**Field descriptions**

The DBGDEVID2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Reserved, RES0.

**Accessing the DBGDEVID2:**

To access the DBGDEVID2:

MRC p14,0,<Rt>,c7,c0,7 ; Read DBGDEVID2 into Rt
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0111</td>
<td>0000</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.3.11 DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

**Purpose**

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

**Usage constraints**

- If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

- If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

ARM deprecates any access to this register from EL0.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:
- If DBGDSCRExt.UDCCdis==1, PL0 read accesses to this register are trapped to Undefined mode.
- If HDCR.TDA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.
- If MDSCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.
- If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

**Attributes**

DBGDIDR is a 32-bit register.

**Field descriptions**

The DBGDIDR bit assignments are:
### WRPs, bits [31:28]

The number of watchpoints implemented, minus 1.
Permitted values of this field are from 0b0001 for 2 implemented watchpoints, to 0b1111 for 16 implemented watchpoints. The value of 0b0000 is reserved.
If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.WRPs.

### BRPs, bits [27:24]

The number of breakpoints implemented, minus 1.
Permitted values of this field are from 0b0001 for 2 implemented breakpoints, to 0b1111 for 16 implemented breakpoints. The value of 0b0000 is reserved.
If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.BRPs.

### CTX_CMPs, bits [23:20]

The number of breakpoints that can be used for Context matching, minus 1.
Permitted values of this field are from 0b0000 for 1 Context matching breakpoint, to 0b1111 for 16 Context matching breakpoints. The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.
If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.CTX_CMPs.

### Version, bits [19:16]

The Debug architecture version. The permitted values of this field are:
- 0001 ARMv6, v6 Debug architecture
- 0010 ARMv6, v6.1 Debug architecture
- 0011 ARMv7, v7 Debug architecture, with baseline CP14 registers implemented
- 0100 ARMv7, v7 Debug architecture, with all CP14 registers implemented
- 0101 ARMv7, v7.1 Debug architecture
- 0110 ARMv8, v8 Debug architecture.
All other values are reserved.

### Bit [15]

Reserved, RES1.

### nSUHD_imp, bit [14]

In ARMv7-A, was Secure User Halting Debug not implemented.
The value of this bit must match the value of the SE_imp bit.
Bit [13]

Reserved, RES0.

SE_imp, bit [12]

EL3 implemented. The meanings of the values of this bit are:
0 EL3 not implemented.
1 EL3 implemented.

The value of this bit must match the value of the nSUHD_imp bit.

Bits [11:0]

Reserved, RES0.

Accessing the DBGDIDR:

To access the DBGDIDR:

MRC p14,0,<Rt>,c0,c0,0 ; Read DBGDIDR into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.3.12 DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

ARM deprecates any access to this register from EL0.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state](#) for exceptions taken to AArch32 state, and [Synchronous exception prioritization](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

If DBGDSCR_ext.UDCCdis=1, PL0 read accesses to this register are trapped to Undefined mode.

If HDCR.TDRA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDRA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to EL2.

If MDCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDRAR is architecturally mapped to AArch64 System register MDRAR_EL1.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

Field descriptions

The DBGDRAR bit assignments are:
When accessing as a 32-bit register:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>11</td>
<td>Valid</td>
<td>This field indicates whether the ROM Table address is valid. The permitted values of this field are:</td>
</tr>
<tr>
<td>0</td>
<td></td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

When accessing as a 64-bit register:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>47</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>12</td>
<td>Valid</td>
<td>This field indicates whether the ROM Table address is valid. The permitted values of this field are:</td>
</tr>
<tr>
<td>2</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td></td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td></td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

Accessing the DBGDRAR:

To access the DBGDRAR when accessing as a 32-bit register:
MRC p14, 0, <Rt>, c1, c0, 0 ; Read DBGDRAR[31:0] into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0001</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>

To access the DBGDRAR when accessing as a 64-bit register:

MRRC p14, 0, <Rt>, <Rt2>, c1 ; Read DBGDRAR[31:0] into Rt and DBGDRAR[63:32] into Rt2

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>0000</td>
<td>0001</td>
</tr>
</tbody>
</table>
G6.3.13  DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

Purpose

In earlier versions of the ARM Architecture, this register defines the offset from the base address defined in DBGDRAR of the physical base address of the debug registers for the PE. This register is deprecated in ARMv8.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

ARM deprecates any access to this register from EL0.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If DBGDSCRext.UDCCdis==1, PL0 read accesses to this register are trapped to Undefined mode.

If HDCR.TDRA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDRA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.

If MDSCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

Field descriptions

The DBGDSAR bit assignments are:
When accessing as a 32-bit register:

![Offset diagram]

Offset, bits [31:0]
This register value is RAZ.

When accessing as a 64-bit register:

![Offset diagram]

Offset, bits [63:0]
This register value is RAZ.

Accessing the DBGDSAR:

To access the DBGDSAR when accessing as a 32-bit register:

```c
MRC p14,0,<Rt>,c2,c0,0 ; Read DBGDSAR[31:0] into Rt
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0010</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>

To access the DBGDSAR when accessing as a 64-bit register:

```c
MRRC p14,0,<Rt>,<Rt2>,c2 ; Read DBGDSAR[31:0] into Rt and DBGDSAR[63:32] into Rt2
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>0000</td>
<td>0010</td>
</tr>
</tbody>
</table>
G6.3.14 DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

**Purpose**

Main control register for the debug implementation.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDSCRext is architecturally mapped to AArch64 System register MDSCR_EL1.

This register is required in all implementations.

**Attributes**

DBGDSCRext is a 32-bit register.

**Field descriptions**

The DBGDSCRext bit assignments are:
Bit [31]
Reserved, RES0.

RXfull, bit [30]
DTRRX full. Used for save/restore of EDSCR.RXfull.
When DBGOSLR.OSLK == 0 (the OS lock is unlocked), this bit is RO.
When DBGOSLR.OSLK == 1 (the OS lock is locked), this bit is RW.
ARM deprecates use of this bit other than for save/restore. Use DBGDSCRint to access the DTRRX full status.

TXfull, bit [29]
DTRTX full. Used for save/restore of EDSCR.TXfull.
When DBGOSLR.OSLK == 0 (the OS lock is unlocked), this bit is RO.
When DBGOSLR.OSLK == 1 (the OS lock is locked), this bit is RW.
ARM deprecates use of this bit other than for save/restore. Use DBGDSCRint to access the DTRTX full status.

Bit [28]
Reserved, RES0.

RXO, bit [27]
Used for save/restore of EDSCR.RXO.
When DBGOSLR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.
When DBGOSLR.OSLK == 1 (the OS lock is locked), this bit is RW.

TXU, bit [26]
Used for save/restore of EDSCR.TXU.
When DBGOSLR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.
When DBGOSLR.OSLK == 1 (the OS lock is locked), this bit is RW.

Bits [25:24]
Reserved, RES0.
INTdis, bits [23:22]  
Used for save/restore of EDSCR.INTdis.  
When DBGOSLR.OSLK == 0 (the OS lock is unlocked), this field is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.  
When DBGOSLR.OSLK == 1 (the OS lock is locked), this field is RW.

TDA, bit [21]  
Used for save/restore of EDSCR.TDA.  
When DBGOSLR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.  
When DBGOSLR.OSLK == 1 (the OS lock is locked), this bit is RW.

Bits [20:19]  
Reserved, RES0.

NS, bit [18]  
Non-secure status. Returns the inverse of IsSecure(). This bit is RO.  
ARM deprecates use of this field.

SPNIDdis, bit [17]  
Secure privileged profiling disabled status bit. This bit is RO and reflects the value of ProfilingProhibited(TRUE,EL1). Permitted values are:  
0 Profiling allowed in Secure privileged modes.  
1 Profiling prohibited in Secure privileged modes.  
ARM deprecates use of this field.

SPIDdis, bit [16]  
Secure privileged AArch32 invasive self-hosted debug disabled status bit. This bit is RO and depends on the value of SDCR.SPD and the pseudocode function AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled(). Permitted values are:  
0 Self-hosted debug enabled in Secure privileged AArch32 modes.  
1 Self-hosted debug disabled in Secure privileged AArch32 modes.  
This bit reads as 1 if any of the following is true and reads as 0 otherwise:  
• SDCR.SPD has the value 10.  
• SDCR.SPD has the value 00 and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.  
ARM deprecates use of this field.

MDBGen, bit [15]  
Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector catch debug exceptions.  
0 Breakpoint, Watchpoint, and Vector catch debug exceptions disabled.  
1 Breakpoint, Watchpoint, and Vector catch debug exceptions enabled.  
When this register has an architecturally-defined reset value, this field resets to 0.  
This field resets to its defined reset value on Warm reset.

HDE, bit [14]  
Used for save/restore of EDSCR.HDE.  
When DBGOSLR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.  
When DBGOSLR.OSLK == 1 (the OS lock is locked), this bit is RW.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN. This field resets to its defined reset value on Warm reset.

**Bit [13]**
Reserved, RES0.

**UDCDis, bit [12]**
Traps PL0 accesses to the DCC registers to Undefined mode.

- 0: PL0 accesses to the DCC registers are not trapped to Undefined mode.
- 1: PL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIDR, DBGDSAR, and DBGDRAR are trapped to Undefined mode.

--- **Note** ---
All accesses to these registers are trapped, including LDC and STC accesses to DBGDTRTXint and DBGDTRRXint, and MRRC accesses to DBGDSAR and DBGDRAR.

Traps of PL0 accesses to the DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

**Bits [11:7]**
Reserved, RES0.

**ERR, bit [6]**
Used for save/restore of EDSCR.ERR.

- When DBGOSLSR.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.
- When DBGOSLSR.OSLK == 1 (the OS lock is locked), this bit is RW.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

**MOE, bits [5:2]**
Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

- 0001: Breakpoint
- 0011: Software breakpoint (BKPT) instruction
- 0101: Vector catch
- 1010: Watchpoint

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

**Bits [1:0]**
Reserved, RES0.

**Accessing the DBGDSCRext:**

To access the DBGDSCRext:

- MRC p14,0,<Rt>,c0,c2,2; Read DBGDSCRext into Rt
- MCR p14,0,<Rt>,c0,c2,2; Write Rt to DBGDSCRext
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0010</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.3.15 DBGDSCRint, Debug Status and Control Register, Internal View

The DBGDSCRint characteristics are:

Purpose

Main control register for the debug implementation. This is an internal, read-only view.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If DBGDSCRext.UDCCdis==1, PL0 read accesses to this register are trapped to Undefined mode.
If HDCR.TDA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to Hyp mode.
If MDCR_EL2.TDA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to EL2.
If MDCR_EL3.TDA==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.
If MDSCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDSCRint is architecturally mapped to AArch64 System register MDCCSR_EL0.

This register is required in all implementations.

DBGDSCRint.{NS, SPNIDdis, SPIIDdis, MDBGen, UDCCdis, MOE} are UNKNOWN when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither UNPREDICTABLE nor return UNKNOWN values, it is permissible for an implementation to return the values of DBGDSCRext.{NS, SPNIDdis, SPIIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

Attributes

DBGDSCRint is a 32-bit register.

Field descriptions

The DBGDSCRint bit assignments are:
Bit [31]
Reserved, RES0.

RXfull, bit [30]
DTRRX full. Read-only view of the equivalent bit in the EDSCR.

TXfull, bit [29]
DTRTX full. Read-only view of the equivalent bit in the EDSCR.

Bits [28:19]
Reserved, RES0.

NS, bit [18]
Non-secure status.
Read-only view of the equivalent bit in the DBGDSCRext. ARM deprecates use of this field.

SPNIDdis, bit [17]
Secure privileged non-invasive debug disable.
Read-only view of the equivalent bit in the DBGDSCRext. ARM deprecates use of this field.

SPItdis, bit [16]
Secure privileged invasive debug disable.
Read-only view of the equivalent bit in the DBGDSCRext. ARM deprecates use of this field.

MDBGen, bit [15]
Monitor debug events enable.
Read-only view of the equivalent bit in the DBGDSCRext.

Bits [14:13]
Reserved, RES0.

UDCCdis, bit [12]
User mode access to Debug Communications Channel disable.
Read-only view of the equivalent bit in the DBGDSCRext. ARM deprecates use of this field.

Bits [11:6]
Reserved, RES0.

MOE, bits [5:2]
Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

0001 Breakpoint
0011 Software breakpoint (BKPT) instruction
0101 Vector catch
1010 Watchpoint

Read-only view of the equivalent bit in the DBGDSRext.

Bits [1:0]

Reserved, RES0.

Accessing the DBGDSRint:

To access the DBGDSRint:

MRC p14,0,<Rt>,c0,c1,0 ; Read DBGDSRint into Rt, where Rt can be R0-R14 or APSR_nzcv.

; The last form writes bits[31:28] of the transferred value to the N, Z, C and V
; condition flags and is specified by setting the RT field of the encoding
; to 0b1111.

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>
### DBGDTRRXext, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRXext characteristics are:

#### Purpose

Used for save/restore of DBGDTRRXint. It is a component of the Debug Communications Channel.

#### Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

ARM deprecates reads and writes of DBGDTRRXext through the CP14 interface when the OS lock is unlocked.

#### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state](#) on page G1-3845 for exceptions taken to AArch32 state, and [Synchronous exception prioritization](#) on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDTRRXext is architecturally mapped to AArch64 System register OSDTRRX_EL1.

#### Attributes

DBGDTRRXext is a 32-bit register.

#### Field descriptions

The DBGDTRRXext bit assignments are:

**Bits [31:0]**

- **Update DTRRX without side-effect**

  Update DTRRX without side-effect.

  Writes to this register update the value in DTRRX and do not change RXfull.

  Reads of this register return the last value written to DTRRX and do not change RXfull.
For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Accessing the DBGDTRRXext:**

To access the DBGDTRRXext:

MRC p14,0,<Rt>,c0,c0,2 ; Read DBGDTRRXext into Rt
MCR p14,0,<Rt>,c0,c0,2 ; Write Rt to DBGDTRRXext

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0000</td>
<td>010</td>
</tr>
</tbody>
</table>
**G6.3.17 DBGDTRRXint, Debug Data Transfer Register, Receive**

The DBGDTRRXint characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communications Channel.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If DBGDSCRext.UDCCdis==1, PL0 read accesses to this register are trapped to Undefined mode.
- If HDCR.TDA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL0 and PL1 read accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.
- If MDSCR_EL1.TDCC==1, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register DBGDTRRXint is architecturally mapped to AArch64 System register DBGDTRRX_EL0.
- AArch32 System register DBGDTRRXint is architecturally mapped to External register DBGDTRRX_EL0.

**Attributes**

DBGDTRRXint is a 32-bit register.

**Field descriptions**

The DBGDTRRXint bit assignments are:

```
+-------+-------+       +-------+-------+
| 31    | 30    | 0       | 31    | 30    |
| Update DTRRX |       |         | Update DTRRX |
```

---

*G6  AArch32 System Register Descriptions*  
*G6.3 Debug registers*
Bits [31:0]

Update DTRRX.

If RXfull is set to 1, then reads of this register return the last value written to DTRRX and clear RXfull to 0.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

Accessing the DBGDTRRXint:

To access the DBGDTRRXint:

MRC p14,0,<Rt>,c0,c5,0 ; Read DBGDTRRXint into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0101</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.3.18 DBGDTRTXext, Debug OS Lock Data Transfer Register, Transmit

The DBGDTRTXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRTXint. It is a component of the Debug Communication Channel.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

ARM deprecates reads and writes of DBGDTRTXext through the CP14 interface when the OS lock is unlocked.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDTRTXext is architecturally mapped to AArch64 System register OSDTRTX_EL1.

**Attributes**

DBGDTRTXext is a 32-bit register.

**Field descriptions**

The DBGDTRTXext bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Return DTRTX without side-effect</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.
For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Accessing the DBGDTRTXext:**

To access the DBGDTRTXext:

MRC p14,0,<Rt>,c0,c3,2 ; Read DBGDTRTXext into Rt
MCR p14,0,<Rt>,c0,c3,2 ; Write Rt to DBGDTRTXext

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>000</td>
<td>011</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.3.19  DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. It is a component of the Debug Communication Channel.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-WO</td>
<td>Config-WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If DBGDSCRext.UDCCdis==1, PL0 write accesses to this register are trapped to Undefined mode.
- If HDCR.TDA==1, Non-secure PL0 and PL1 write accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL0 and PL1 write accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL0, PL1, and PL2 write accesses to this register are trapped to EL3.
- If MDSCR_EL1.TDCC==1, PL0 write accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDTRTXint is architecturally mapped to AArch64 System register DBGDTRTX_EL0.

AArch32 System register DBGDTRTXint is architecturally mapped to External register DBGDTRTX_EL0.

**Attributes**

DBGDTRTXint is a 32-bit register.

**Field descriptions**

The DBGDTRTXint bit assignments are:

```
31 0

Return DTRTX
```
Bits [31:0]

Return DTRTX.

If TXfull is set to 0, then writes of this register update the value in DTRTX and set TXfull to 1.

For the full behavior of the Debug Communications Channel, see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Cold reset.

**Accessing the DBGDTRTXint:**

To access the DBGDTRTXint:

```
MCR p14,0,<Rt>,c0,c5,0 ; Write Rt to DBGDTRTXint
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0101</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.3.20 DBGOSDLR, Debug OS Double Lock Register

The DBGOSDLR characteristics are:

**Purpose**

Locks out the external debug interface.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDOSA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDOSA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDOSA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGOSDLR is architecturally mapped to AArch64 System register OSDLR_EL1.

**Attributes**

DBGOSDLR is a 32-bit register.

**Field descriptions**

The DBGOSDLR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.
DLK, bit [0]

OS Double Lock control bit. Possible values are:

0  OS Double Lock unlocked.
1  OS Double Lock locked, if DBGPRCR.CORENPDRQ (Core no powerdown request)
   bit is set to 0 and the PE is in Non-debug state.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

Accessing the DBGOSDLR:

To access the DBGOSDLR:

MRC p14,0,<Rt>,c1,c3,4 ; Read DBGOSDLR into Rt
MCR p14,0,<Rt>,c1,c3,4 ; Write Rt to DBGOSDLR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0001</td>
<td>0011</td>
<td>100</td>
</tr>
</tbody>
</table>
G6.3.21  DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register DBGOSECCR is architecturally mapped to AArch64 System register OSECCR_EL1.
- AArch32 System register DBGOSECCR is architecturally mapped to External register EDECCR.

**Attributes**

DBGOSECCR is a 32-bit register.

**Field descriptions**

The DBGOSECCR bit assignments are:

*When OSLR.OSLK==1:*

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EDECCR</td>
</tr>
</tbody>
</table>

EDECCR, bits [31:0]

Used for save/restore to EDECCR over powerdown.
Accessing the DBGOSCCR:

To access the DBGOSCCR:

MRC p14,0,<Rt>,c0,c6,2 ; Read DBGOSCCR into Rt
MCR p14,0,<Rt>,c0,c6,2 ; Write Rt to DBGOSCCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0110</td>
<td>010</td>
</tr>
</tbody>
</table>
### G6.3.22 DBGOSLAR, Debug OS Lock Access Register

The DBGOSLAR characteristics are:

**Purpose**

Provides a lock for the debug registers. The OS lock also disables some Software debug events.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDOSA==1, Non-secure PL1 write accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDOSA==1, Non-secure PL1 write accesses to this register are trapped to EL2.
- If MDCR_EL3.TDOSA==1, PL1 and PL2 write accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register DBGOSLAR is architecturally mapped to AArch64 System register OSLAR_EL1.
- AArch32 System register DBGOSLAR is architecturally mapped to External register OSLAR_EL1.

**Attributes**

DBGOSLAR is a 32-bit register.

**Field descriptions**

The DBGOSLAR bit assignments are:

```
31 0

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>OS Lock Access</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**Bits [31:0]**

OS Lock Access. Writing the value 0xC5ACE55 to the DBGOSLAR sets the OS lock to 1. Writing any other value sets the OS lock to 0.

Use DBGOSLRSR.OSLK to check the current status of the lock.
Accessing the DBGOSLR:

To access the DBGOSLR:

MCR p14,0,<Rt>,c1,c0,4 ; Write Rt to DBGOSLR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0001</td>
<td>0000</td>
<td>100</td>
</tr>
</tbody>
</table>
G6.3.23 DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

**Purpose**

Provides status information for the OS lock.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDOSA==1, Non-secure PL1 read accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDOSA==1, Non-secure PL1 read accesses to this register are trapped to EL2.
- If MDCR_EL3.TDOSA==1, PL1 and PL2 read accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGOSLSR is architecturally mapped to AArch64 System register OSLR_EL1.

The OS lock status is also visible in the external debug interface through EDPRSR.

**Attributes**

DBGOSLSR is a 32-bit register.

**Field descriptions**

The DBGOSLSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td></td>
<td>OSLM[0]</td>
</tr>
<tr>
<td></td>
<td>OSLK</td>
</tr>
<tr>
<td></td>
<td>nTT</td>
</tr>
<tr>
<td></td>
<td>OSLM[1]</td>
</tr>
</tbody>
</table>

...
Bits [31:4]
Reserved, RES0.

OSLM[1], bit [3]
See below for description of the OSLM field.

nTT, bit [2]
Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]
OS Lock Status. The possible values are:
0 OS lock unlocked.
1 OS lock locked.
The OS lock is locked and unlocked by writing to the OS Lock Access Register.
When this register has an architecturally-defined reset value, this field resets to 1.
This field resets to its defined reset value on Cold reset.

OSLM[0], bit [0]
OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.
In ARMv8 these bits are as follows:
10 OS lock implemented. DBGOSSRR not implemented.
All other values are reserved.

Accessing the DBGOSLSR:
To access the DBGOSLSR:
MRC p14,0,<Rt>,c1,c1,4 ; Read DBGOSLSR into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0001</td>
<td>0001</td>
<td>100</td>
</tr>
</tbody>
</table>
### G6.3.24 DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

**Purpose**

Controls behavior of the PE on powerdown request.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDOSA=1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDOSA=1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDOSA=1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGPRCR is architecturally mapped to AArch64 System register DBGPRCR_EL1.

- Bit [0] of this register is mapped to EDPRCR.CORENPDRQ, bit [0] of the external view of this register.
- The other bits in these registers are not mapped to each other.

**Attributes**

DBGPRCR is a 32-bit register.

**Field descriptions**

The DBGPRCR bit assignments are:

```
 31  1  0
     RES0
         |
         | CORENPDRQ
```
Bits [31:1]

Reserved, RES0.

**CORENPDRQ, bit [0]**

Core no powerdown request. Requests emulation of powerdown. Possible values of this bit are:

0 On a powerdown request, the system powers down the Core power domain.
1 On a powerdown request, the system emulates powerdown of the Core power domain. In this emulation mode the Core power domain is not actually powered down.

Writes to this bit are permitted regardless of the state of the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request Core no powerdown regardless of whether invasive debug is permitted.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPPCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state.

When this register has an architecturally-defined reset value, this field resets to the value of EDPPCR.COREPURQ.

This field resets to its defined reset value on Cold reset.

**Accessing the DBGPRCR:**

To access the DBGPRCR:

MRC p14,0,<Rt>,c1,c4,4 ; Read DBGPRCR into Rt
MCR p14,0,<Rt>,c1,c4,4 ; Write Rt to DBGPRCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0001</td>
<td>0100</td>
<td>100</td>
</tr>
</tbody>
</table>
## G6.3.25 DBGVCR, Debug Vector Catch Register

The DBGVCR characteristics are:

### Purpose
Controls Vector catch debug events.

### Usage constraints
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

### Traps and Enables
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

### Configurations
There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGVCR is architecturally mapped to AArch64 System register DBGVCR32_EL2.

This register is required in all implementations.

### Attributes
DBGVCR is a 32-bit register.

### Field descriptions
The DBGVCR bit assignments are:
When EL3 implemented and using AArch32:

NSF, bit [31]
- FIQ vector catch enable in Non-secure state.
- The exception vector offset is 0x1C.
- When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
- This field resets to its defined reset value on Warm reset.

NSI, bit [30]
- IRQ vector catch enable in Non-secure state.
- The exception vector offset is 0x18.
- When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
- This field resets to its defined reset value on Warm reset.

Bit [29]
- Reserved, RES0.

NSD, bit [28]
- Data Abort vector catch enable in Non-secure state.
- The exception vector offset is 0x10.
- When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
- This field resets to its defined reset value on Warm reset.

NSP, bit [27]
- Prefetch Abort vector catch enable in Non-secure state.
- The exception vector offset is 0x0C.
- When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
- This field resets to its defined reset value on Warm reset.

NSS, bit [26]
- Supervisor Call (SVC) vector catch enable in Non-secure state.
- The exception vector offset is 0x08.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**Bits [24:16]**

Reserved, RES0.

**MF, bit [15]**

FIQ vector catch enable in Monitor mode.

The exception vector offset is 0x1C.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**MI, bit [14]**

IRQ vector catch enable in Monitor mode.

The exception vector offset is 0x18.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**Bit [13]**

Reserved, RES0.

**MD, bit [12]**

Data Abort vector catch enable in Monitor mode.

The exception vector offset is 0x10.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**MP, bit [11]**

Prefetch Abort vector catch enable in Monitor mode.

The exception vector offset is 0x0C.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**MS, bit [10]**

Secure Monitor Call (SMC) vector catch enable in Monitor mode.

The exception vector offset is 0x08.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.
Bits [9:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.
The exception vector offset is 0x1C.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

SI, bit [6]

IRQ vector catch enable in Secure state.
The exception vector offset is 0x18.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.
The exception vector offset is 0x10.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.
The exception vector offset is 0x0C.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.
The exception vector offset is 0x08.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.
The exception vector offset is 0x04.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

Bit [0]

Reserved, RES0.
**When EL3 implemented and using AArch64:**

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**Bit [29]**

Reserved, **RES0**.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is 0x0C.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is 0x08.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.
NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

Bits [24:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is 0x1C.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is 0x18.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.

The exception vector offset is 0x10.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is 0x0C.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is 0x08.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

Bit [0]
Reserved, RES0.

*When EL3 not implemented:*

<table>
<thead>
<tr>
<th>31</th>
<th>RES0</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
</table>

Bits [31:8]
Reserved, RES0.

F, bit [7]
FIQ vector catch enable.
The exception vector offset is 0x1C.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

I, bit [6]
IRQ vector catch enable.
The exception vector offset is 0x18.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

Bit [5]
Reserved, RES0.

D, bit [4]
Data Abort vector catch enable.
The exception vector offset is 0x10.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

P, bit [3]
Prefetch Abort vector catch enable.
The exception vector offset 0x0C.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.
S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is 0x08.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is 0x04.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

Bit [0]

Reserved, RES0.

Accessing the DBGVCR:

To access the DBGVCR:

MRC p14,0,<Rt>,c0,c7,0 ; Read DBGVCR into Rt
MCR p14,0,<Rt>,c0,c7,0 ; Write Rt to DBGVCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0111</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.3.26 DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>, where n is 0 to 15.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

When the E field is zero, all the other fields in the register are ignored.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see:

- *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state.
- *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state.
- *Software Access debug event on page H3-5037* for accesses to this register trapped to Debug state.

Subject to the prioritization rules:

If EDSCR.TDA==1, and OSLSR.OSLK==0, PL1 and PL2 accesses to this register are trapped to Debug state.

If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGWCR<n> is architecturally mapped to AArch64 System register DBGWCR<n>_EL1.

AArch32 System register DBGWCR<n> is architecturally mapped to External register DBGWCR<n>_EL1.

**Attributes**

DBGWCR<n> is a 32-bit register.

**Field descriptions**

The DBGWCR<n> bit assignments are:
**Bits [31:29]**
Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

- **00000** No mask.
- **00001** Reserved.
- **00010** Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:
- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00001 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [23:21]**
Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

- **0** Unlinked data address match.
- **1** Linked data address match.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Cold reset.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n> is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxxxxxx1</td>
<td>Match byte at DBGWVR&lt;n&gt;</td>
</tr>
<tr>
<td>xxxxxx1x</td>
<td>Match byte at DBGWVR&lt;n&gt;+1</td>
</tr>
<tr>
<td>xxxxx1xx</td>
<td>Match byte at DBGWVR&lt;n&gt;+2</td>
</tr>
<tr>
<td>xxxx1xxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+3</td>
</tr>
</tbody>
</table>

In cases where DBGWVR<n> addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;n&gt;[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+4</td>
</tr>
<tr>
<td>xx1xxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+5</td>
</tr>
<tr>
<td>x1xxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+6</td>
</tr>
<tr>
<td>1xxxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+7</td>
</tr>
</tbody>
</table>

The valid values for BAS are 0b00000000, or a binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software.

If BAS is zero, no bytes are watched by this watchpoint.

Ignored if E is 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made.

Possible values of this field are:

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>Match instructions that load from a watchpointed address.</td>
</tr>
<tr>
<td>10</td>
<td>Match instructions that store to a watchpointed address.</td>
</tr>
<tr>
<td>11</td>
<td>Match instructions that load from or store to a watchpointed address.</td>
</tr>
</tbody>
</table>

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.
Ignored if E is 0.

When this register has an architecturally-defined reset value, this field resets to a value that is
architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a watchpoint debug
event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC
fields.

When this register has an architecturally-defined reset value, this field resets to a value that is
architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**E, bit [0]**

Enable watchpoint n. Possible values are:

0 Watchpoint disabled.

1 Watchpoint enabled.

When this register has an architecturally-defined reset value, this field resets to a value that is
architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Accessing the DBGWCR<n>:**

To access the DBGWCR<n>:

MRC p14,0,<Rt>,c0,<CRm>,7 ; Read DBGWCR<n> into Rt, where n is in the range 0 to 15
MCR p14,0,<Rt>,c0,<CRm>,7 ; Write Rt to DBGWCR<n>, where n is in the range 0 to 15

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>n&lt;3:0&gt;</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.3.27  DBGWFAR, Debug Watchpoint Fault Address Register

The DBGWFAR characteristics are:

**Purpose**

Previously returned information about the address of the instruction that accessed a watchpointed address. Is now deprecated and RAZ.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HDCR.TDA==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

DBGWFAR is a 32-bit register.

**Field descriptions**

The DBGWFAR bit assignments are:

31

RES0

0

**Bits [31:0]**

Reserved, RES0.

**Accessing the DBGWFAR:**

To access the DBGWFAR:

- MRC p14,0,<Rt>,c0,c6,0 ; Read DBGWFAR into Rt
- MCR p14,0,<Rt>,c0,c6,0 ; Write Rt to DBGWFAR
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>0110</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.3.28  DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>, where n is 0 to 15.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see:

- *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state.
- *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state.
- *Software Access debug event* on page H3-5037 for accesses to this register trapped to Debug state.

Subject to the prioritization rules:

- If EDSCR.TDA==1, and OSLSR.OSLK==0, PL1 and PL2 accesses to this register are trapped to Debug state.
- If MDCR_EL2.TDA==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TDA==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register DBGWVR<n> is architecturally mapped to AArch64 System register DBGWVR<n>_EL1[31:0].
- AArch32 System register DBGWVR<n> is architecturally mapped to External register DBGWVR<n>_EL1[31:0].

**Attributes**

DBGWVR<n> is a 32-bit register.

**Field descriptions**

The DBGWVR<n> bit assignments are:
VA, bits [31:2]

Bits[31:2] of the address value for comparison.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

Bits [1:0]

Reserved, RES0.

Accessing the $DBGWVR<n>$:

To access the $DBGWVR<n>$:

MRC p14,0,<Rt>,c0,<CRm>,6 ; Read $DBGWVR<n>$ into Rt, where n is in the range 0 to 15
MCR p14,0,<Rt>,c0,<CRm>,6 ; Write Rt to $DBGWVR<n>$, where n is in the range 0 to 15

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1110</td>
<td>000</td>
<td>0000</td>
<td>$n&lt;3:0&gt;$</td>
<td>110</td>
</tr>
</tbody>
</table>
**G6.3.29 DLR, Debug Link Register**

The DLR characteristics are:

**Purpose**

In Debug state, holds the address to restart from.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Access to this register is from Debug state only. During normal execution this register is unallocated.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states. AArch32 System register DLR is architecturally mapped to AArch64 System register DLR_EL[31:0].

**Attributes**

DLR is a 32-bit register.

**Field descriptions**

The DLR bit assignments are:

```
<table>
<thead>
<tr>
<th></th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Restart address</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**Accessing the DLR:**

To access the DLR:

- `MRC p15,3,<Rt>,c4,c5,1 ; Read DLR into Rt`
- `MCR p15,3,<Rt>,c4,c5,1 ; Write Rt to DLR`
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>011</td>
<td>0100</td>
<td>0101</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.3.30 DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

Purpose

Holds the saved process state on entry to Debug state.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Access to this register is from Debug state only. During normal execution this register is unallocated.

Traps and Enables

There are no traps or enables affecting this register.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DSPSR is architecturally mapped to AArch64 System register DSPSR_EL0.

Attributes

DSPSR is a 32-bit register.

Field descriptions

The DSPSR bit assignments are:

_When entering Debug state from AArch32 and exiting Debug state to AArch32:_

|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|----------------|----------------|-------------|-------------|-------------|-------------|-------------|----------------|

N, bit [31]

Set to the value of CPSR.N on entering Debug state, and copied to CPSR.N on exiting Debug state.

Z, bit [30]

Set to the value of CPSR.Z on entering Debug state, and copied to CPSR.Z on exiting Debug state.
C, bit [29]
Set to the value of CPSR.C on entering Debug state, and copied to CPSR.C on exiting Debug state.

V, bit [28]
Set to the value of CPSR.V on entering Debug state, and copied to CPSR.V on exiting Debug state.

Q, bit [27]
Set to the value of CPSR.Q on entering Debug state, and copied to CPSR.Q on exiting Debug state.

IT[1:0], bits [26:25]
If-Then Execution State bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

J, bit [24]
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bits [23:22]
Reserved, RES0.

SS, bit [21]
Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

IL, bit [20]
Illegal Execution State bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]
If-Then Execution State bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.
• IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
• IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.
The IT field is 0b00000000 when no IT block is active.

E, bit [9]
Endianness Execution State bit. Controls the load and store endianness for data accesses:
0 Little-endian operation
1 Big-endian operation.
Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.
Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]
Asynchronous data abort mask bit. The possible values of this bit are:
0  Exception not masked.
1  Exception masked.

I, bit [7]
IRQ mask bit. The possible values of this bit are:
0  Exception not masked.
1  Exception masked.

F, bit [6]
FIQ mask bit. The possible values of this bit are:
0  Exception not masked.
1  Exception masked.

T, bit [5]
T32 Instruction set state bit. Determines the AArch32 instruction set state that the Debug state entry was taken from. Possible values of this bit are:
0  Taken from A32 state.
1  Taken from T32 state.

M[4], bit [4]
Execution state that Debug state was entered from. Possible values of this bit are:
1  Exception taken from AArch32.

M[3:0], bits [3:0]
AArch32 mode that Debug state was entered from. The possible values are:

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor</td>
</tr>
<tr>
<td>0b0110</td>
<td>Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined</td>
</tr>
<tr>
<td>0b1111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved.

Accessing the DSPSR:
To access the DSPSR:
MRC p15,3,<Rt>,c4,c5,0 ; Read DSPSR into Rt
MCR p15,3,<Rt>,c4,c5,0 ; Write Rt to DSPSR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>011</td>
<td>0100</td>
<td>0101</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.3.31  HDCR, Hyp Debug Control Register

The HDCR characteristics are:

Purpose

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors extension.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, PL2 accesses to this register are trapped to EL3.

Configurations

AArch32 System register HDCR is architecturally mapped to AArch64 System register MDCR_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDCR is a 32-bit register.

Field descriptions

The HDCR bit assignments are:
Bits [31:12]

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps Non-secure PL0 and PL1 CP14 accesses to the Debug ROM registers to Hyp mode.

0  Non-secure PL0 and PL1 CP14 accesses to the Debug ROM registers are not trapped to Hyp mode.
1  Non-secure PL0 and PL1 CP14 accesses to the DBGDRAR or DBGDSAR are trapped to Hyp mode.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

TDOSA, bit [10]

Trap debug OS-related register access. Traps Non-secure PL1 CP14 accesses to the powerdown debug registers to Hyp mode.

0  Non-secure PL1 CP14 accesses to the powerdown debug registers are not trapped to Hyp mode.
1  Non-secure PL1 CP14 accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- **DBGOSLSR, DBGOSLAR, DBGOSDLR**, and the **DBGPRCR**.
- Any IMPLEMENTATION DEFINED integration registers.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

______ Note _______

These registers are not accessible at PL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.
TDA, bit [9]

Trap debug access. Traps Non-secure PL0 and PL1 CP14 accesses to those CP14 registers that are not trapped by either of the following:

- HDCR.TDRA.
- HDCR.TDOSA.

0  Has no effect on CP14 accesses to the debug registers.
1  Non-secure PL0 or PL1 CP14 accesses to the debug registers, other than the registers trapped by HDCR.TDRA and HDCR.TDOSA, are trapped to Hyp mode.

HDCR.TDA does not trap accesses to the DBGDTRRXint or DBGDTRTXint when the PE is in Debug state.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

TDE, bit [8]

Trap Debug exceptions. The possible values of this bit are:

0  Has no effect on Debug exceptions.
1  Route Non-secure Debug exceptions to Hyp mode.

When the value of this bit is 1, any Debug exception taken from Non-secure state is routed to Hyp mode.

If HCR.TGE == 1, then this bit is ignored and treated as though it is 1 other than for the value read back from HDCR.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

HPME, bit [7]

Hypervisor Performance Monitors Enable. The possible values of this bit are:

0  Hyp mode Performance Monitors disabled.
1  Hyp mode Performance Monitors enabled.

When the value of this bit is 1, the Performance Monitors counters that are reserved for use from Hyp mode or Secure state are enabled. For more information see the description of the HPMN field.

If the Performance Monitors extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

TPM, bit [6]

Trap Performance Monitors accesses. Traps Non-secure PL0 and PL1 accesses to all Performance Monitors registers to Hyp mode.

0  Non-secure PL0 and PL1 accesses to all Performance Monitors registers are not trapped to Hyp mode.
1  Non-secure PL0 and PL1 accesses to all Performance Monitors registers are trapped to Hyp mode.

--- Note ---

- EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.
- If the Performance Monitors extension is not implemented, this field is RES0.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

TPMCR, bit [5]
Trap PMCR accesses. Traps Non-secure PL0 and PL1 accesses to the PMCR to Hyp mode.
0 Non-secure PL0 and PL1 accesses to the PMCR are not trapped to Hyp mode.
1 Non-secure PL0 and PL1 accesses to the PMCR are trapped to Hyp mode.

Note
• EL2 does not provide traps on Performance Monitor register accesses through the optional
  memory-mapped external debug interface.
• If the Performance Monitors extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

HPMN, bits [4:0]
Defines the number of Performance Monitors counters that are accessible from Non-secure EL1
modes, and from Non-secure EL0 modes if unprivileged access is enabled.
If the Performance Monitors extension is not implemented, this field is RES0.
In Non-secure state, HPMN divides the Performance Monitors counters as follows. If software is
accessing Performance Monitors counter n then, in Non-secure state:
• If n is in the range 0≤n<HPMN, the counter is accessible from EL1 and EL2, and from EL0
  if unprivileged access to the counters is enabled. PMCR.E enables the operation of counters
  in this range.
• If n is in the range HPMN≤n<PMCR.N, the counter is accessible only from EL2. HPMEN and
  HPME enables the operation of counters in this range.
If this field is set to 0, or to a value larger than PMCR.N, then the behavior in Non-secure EL0 and
EL1 is CONSTRAINED UNPREDICTABLE, and one of the following must happen:
• The number of counters accessible is an UNKNOWN non-zero value less than PMCR.N.
• There is no access to any counters.
For reads of HPMN by EL2 or higher, if this field is set to 0 or to a value larger than
PMCR.N, the PE must return a CONSTRAINED UNPREDICTABLE value being one of:
• PMCR.N.
• The value that was written to HPMN.
• (The value that was written to HPMN) modulo 2^h, where h is the smallest number of
  bits required for a value in the range 0 to PMCR.N.
When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION
DEFINED value, that might be UNKNOWN.
This field resets to its defined reset value on Warm reset.

Accessing the HDCR:
To access the HDCR:

MRC p15,4,<Rt>,c1,c1,1 ; Read HDCR into Rt
MCR p15,4,<Rt>,c1,c1,1 ; Write Rt to HDCR
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>0001</td>
<td>0001</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.3.32  SDCR, Secure Debug Configuration Register

The SDCR characteristics are:

**Purpose**

Controls debug and performance monitors functionality in Secure state.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is implemented and is using AArch64, any read or write to SDCR in Secure EL1 state in AArch32 is trapped as an exception to EL3.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register SDCR can be mapped to AArch64 System register MDCR_EL3, but this is not architecturally mandated.

**Attributes**

SDCR is a 32-bit register.

**Field descriptions**

The SDCR bit assignments are:

- 31: RES0
- 22: SPD
- 13: RES0
- 19: EPMAD
- 14: EDAD
- 15: RES0
- 16: SPME
- 17: RES0
Bits [31:22]
Reserved, RES0.

EPMAD, bit [21]
External debug interface Performance Monitors registers disable. This disables access to these registers by an external debugger:

0 Access to Performance Monitors registers from external debugger is permitted.
1 Access to Performance Monitors registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors extension is not implemented or does not support external debug interface accesses this bit is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

EDAD, bit [20]
External debug interface breakpoint and watchpoint register access disable. This disables access to these registers by an external debugger:

0 Access to breakpoint and watchpoint registers from external debugger is permitted.
1 Access to breakpoint and watchpoint registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

Bits [19:18]
Reserved, RES0.

SPME, bit [17]
Secure Performance Monitors enable. This allows event counting in Secure state:

0 Event counting prohibited in Secure state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.
1 Event counting allowed in Secure state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

Bit [16]
Reserved, RES0.

SPD, bits [15:14]
AArch32 Secure privileged debug. Enables or disables debug exceptions from Secure state, other than Software breakpoint instructions. Valid values for this field are:

00 Legacy mode. Debug exceptions from Secure EL1 are enabled by the authentication interface.
10 Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
11 Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
Otherwise, debug exceptions from Secure EL0 are enabled only if SDER32_EL3.SUIDEN == 1.
Ignored in Non-secure state. Debug exceptions from Software breakpoint instruction debug events are always enabled.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

**Bits [13:0]**

Reserved, RES0.

**Accessing the SDCR:**

To access the SDCR:

MRC p15,0,<Rt>,c1,c3,1 ; Read SDCR into Rt
MCR p15,0,<Rt>,c1,c3,1 ; Write Rt to SDCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0001</td>
<td>0011</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.3.33  SDER, Secure Debug Enable Register

The SDER characteristics are:

Purpose

Controls invasive and non-invasive debug in the Secure EL0 mode.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.

Configurations

This register is only accessible in Secure state.

AArch32 System register SDER is architecturally mapped to AArch64 System register SDER32_EL3.

If EL3 is not implemented and EL1 supports AArch32, SDER is implemented only if the implemented Security state is Secure state.

Attributes

SDER is a 32-bit register.

Field descriptions

The SDER bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

RES0

- Reserved, RES0.
SUNIDEN, bit [1]
Secure User Non-Invasive Debug Enable:
0    Performance Monitors event counting prohibited in Secure EL0 unless allowed by MDCR_EL3.SPME, SDCR.SPME, or the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().
1    Performance Monitors event counting allowed in Secure EL0.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

SUIDEN, bit [0]
Secure User Invasive Debug Enable:
0    Debug exceptions other than Software Breakpoint Instruction exceptions from Secure EL0 are disabled, unless enabled by MDCR_EL3.SPD32 or SDCR.SPD.
1    Debug exceptions from Secure EL0 are enabled.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

Accessing the SDER:
To access the SDER:

MRC p15,0,<Rt>,c1,c1,1 ; Read SDER into Rt
MCR p15,0,<Rt>,c1,c1,1 ; Write Rt to SDER

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0001</td>
<td>0001</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.4 Performance Monitors registers

This section lists the Performance Monitors registers in AArch32.
G6.4.1 PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR, increments.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

PMCCFILTR can also be accessed by using PMXEVTYPER with PMSELR.SEL set to 0b11111.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.
- If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.
- If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register PMCCFILTR is architecturally mapped to AArch64 System register PMCCFILTR_EL0.
- AArch32 System register PMCCFILTR is architecturally mapped to External register PMCCFILTR_EL0.

Some or all RW fields of this register have defined reset values. These apply on Warm reset, and only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PMCCFILTR is a 32-bit register.

**Field descriptions**

The PMCCFILTR bit assignments are:
P, bit [31]

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

- 0: Count cycles in EL1.
- 1: Do not count cycles in EL1.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

U, bit [30]

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

- 0: Count cycles in EL0.
- 1: Do not count cycles in EL0.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Non-secure EL1 are counted. Otherwise, cycles in Non-secure EL1 are not counted.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

NSU, bit [28]

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted. Otherwise, cycles in Non-secure EL0 are not counted.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

NSH, bit [27]

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

- 0: Do not count cycles in EL2.
- 1: Count cycles in EL2.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.
Bits [26:0]

Reserved, RES0.

Accessing the PMCCFILTR:

To access the PMCCFILTR:

MRC p15, 0, <Rt>, c14, c15, 7 ; Read PMCCFILTR into Rt
MCR p15, 0, <Rt>, c14, c15, 7 ; Write Rt to PMCCFILTR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1110</td>
<td>1111</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.4.2 PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter* on page D5-1850 for more information.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

The PMCR.{LC, D} bits configure whether PMCCNTR increments every clock cycle, or once every 64 clock cycles.

PMCCFILTR determines the modes and states in which the PMCCNTR can increment.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.
If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.
If PMUSERENR.CR==0, and PMUSERENR.EN==0, PL0 read accesses to this register are trapped to Undefined mode.
If PMUSERENR.EN==0, PL0 write accesses to this register are trapped to Undefined mode.
If PMUSERENR_EL0.CR==0, and PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.
If PMUSERENR_EL0.EN==0, PL0 write accesses to this register are trapped to EL1.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

PMCCNTR is architecturally mapped to AArch64 System register PMCCNTR_EL0.
PMCCNTR is architecturally mapped to External register PMCCNTR_EL0.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.
Attributes

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

Field descriptions

The PMCCNTR bit assignments are:

*When accessing as a 32-bit register:*

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCNT</td>
<td></td>
</tr>
</tbody>
</table>

CCNT, bits [31:0]

Cycle count. Depending on the values of PMCR.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

*When accessing as a 64-bit register:*

<table>
<thead>
<tr>
<th>63</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCNT</td>
<td></td>
</tr>
</tbody>
</table>

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

Accessing the PMCCNTR:

To access the PMCCNTR when accessing as a 32-bit register:

MRC p15,0,<Rt>,c9,c13,0 ; Read PMCCNTR[31:0] into Rt
MCR p15,0,<Rt>,c9,c13,0 ; Write Rt to PMCCNTR[31:0]. PMCCNTR[63:32] are unchanged

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1101</td>
<td>000</td>
</tr>
</tbody>
</table>

To access the PMCCNTR when accessing as a 64-bit register:

MRRC p15,0,<Rt>,<Rt2>,c9 ; Read PMCCNTR[31:0] into Rt and PMCCNTR[63:32] into Rt2
MCRR p15,0,<Rt>,<Rt2>,c9 ; Write Rt to PMCCNTR[31:0] and Rt2 to PMCCNTR[63:32]
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0000</td>
<td>1001</td>
</tr>
</tbody>
</table>
### G6.4.3 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

#### Purpose

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

#### Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

#### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TPM==1, Non-secure PL0 and PL1 read accesses to this register are trapped to Hyp mode.
- If HISTR.T9==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.
- If HISTR_EL2.T9==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.
- If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 read accesses to this register are trapped to EL2.
- If MDCR_EL3.TPM==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.
- If PMUSERENR.EN==0, PL0 read accesses to this register are trapped to Undefined mode.
- If PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register PMCEID0 is architecturally mapped to AArch64 System register PMCEID0_EL0.
- AArch32 System register PMCEID0 is architecturally mapped to External register PMCEID0_EL0.

#### Attributes

PMCEID0 is a 32-bit register.

#### Field descriptions

The PMCEID0 bit assignments are:

```
  31  0
  ID[31:0]
```
ID[31:0], bits [31:0]

PMCEID0[n] maps to event n. For a list of event numbers and descriptions, see Events, Event numbers and mnemonics on page D5-1865.

For each bit:

0  The common event is not implemented.
1  The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

Accessing the PMCEID0:

To access the PMCEID0:

MRC p15, 0, <Rt>, c9, c12, 6 ; Read PMCEID0 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1100</td>
<td>110</td>
</tr>
</tbody>
</table>
G6.4.4 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HPCR.TPM==1, Non-secure PL0 and PL1 read accesses to this register are trapped to Hyp mode.
If HSTR.T9==1, Non-secure EL0 and EL1 read accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T9==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.
If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 read accesses to this register are trapped to EL2.
If MDCR_EL3.TPM==1, PL0, PL1, and PL2 read accesses to this register are trapped to EL3.
If PMUSERENR.EN==0, PL0 read accesses to this register are trapped to Undefined mode.
If PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register PMCEID1 is architecturally mapped to AArch64 System register PMCEID1_EL0.
AArch32 System register PMCEID1 is architecturally mapped to External register PMCEID1_EL0.

**Attributes**

PMCEID1 is a 32-bit register.

**Field descriptions**

The PMCEID1 bit assignments are:

```
<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID[63:32]</td>
<td></td>
</tr>
</tbody>
</table>
```
ID[63:32], bits [31:0]

PMCEID1[n] maps to event (n + 32). For a list of event numbers and descriptions, see Events, Event numbers and mnemonics on page D5-1865.

For each bit:
0  The common event is not implemented.
1  The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

Accessing the PMCEID1:

To access the PMCEID1:

MRC p15,0,<Rt>,c9,c12,7 ; Read PMCEID1 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1100</td>
<td>111</td>
</tr>
</tbody>
</table>
### G6.4.5 PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<->. Reading this register shows which counters are enabled.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th></th>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th></th>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td></td>
</tr>
</tbody>
</table>

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMCNTENCLR. See the description of the Px bit.

PMCNTENCLR is used in conjunction with the PMCNTENSET register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.
If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.
If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.
If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCNTENCLR is architecturally mapped to AArch64 System register PMCNTENCLR_EL0.
AArch32 System register PMCNTENCLR is architecturally mapped to External register PMCNTENCLR_EL0.

On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PMCNTENCLR is a 32-bit register.

**Field descriptions**

The PMCNTENCLR bit assignments are:
C, bit [31]

PMCCNTR disable bit. Disables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

P<x>, bit [x], for x = 0 to 30

Event counter disable bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

- When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN.
- Otherwise, N is the value in PMCR.N.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>When read, means that PMEVCNTR&lt;x&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>1</td>
<td>When read, means that PMEVCNTR&lt;x&gt; is enabled. When written, disables PMEVCNTR&lt;x&gt;.</td>
</tr>
</tbody>
</table>

Accessing the PMCNTENCLR:

To access the PMCNTENCLR:

- MRC p15,0,<Rt>,c9,c12,2 ; Read PMCNTENCLR into Rt
- MCR p15,0,<Rt>,c9,c12,2 ; Write Rt to PMCNTENCLR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1100</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.4.6  PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

Purpose

Enables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<>. Reading this register shows which counters are enabled.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMCNTENSET. See the description of the Px bit.

PMCNTENSET is used in conjunction with the PMCNTENCLR register.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.
If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.
If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.
If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register PMCNTENSET is architecturally mapped to AArch64 System register PMCNTENSET_EL0.
AArch32 System register PMCNTENSET is architecturally mapped to External register PMCNTENSET_EL0.

On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

PMCNTENSET is a 32-bit register.
Field descriptions

The PMCNTENSET bit assignments are:

<table>
<thead>
<tr>
<th>31 30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;x&gt;, bit [x]</td>
</tr>
</tbody>
</table>

C, bit [31]

PMCCNTR enable bit. Enables the cycle counter register. Possible values are:

0  When read, means the cycle counter is disabled. When written, has no effect.
1  When read, means the cycle counter is enabled. When written, enables the cycle counter.

P<x>, bit [x], for x = 0 to 30

Event counter enable bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

Possible values of each bit are:

0  When read, means that PMEVCNTR<x> is disabled. When written, has no effect.
1  When read, means that PMEVCNTR<x> event counter is enabled. When written, enables PMEVCNTR<x>.

Accessing the PMCNTENSET:

To access the PMCNTENSET:

MRC p15,0,<Rt>,c9,c12,1 ; Read PMCNTENSET into Rt
MCR p15,0,<Rt>,c9,c12,1 ; Write Rt to PMCNTENSET

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1100</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.4.7 PMCR, Performance Monitors Control Register

The PMCR characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
- If HDCR.TPMC==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
- If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.
- If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
- If MDCR_EL2.TPMC==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.
- If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.
- If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register PMCR is architecturally mapped to AArch64 System register PMCR_EL0.
- AArch32 System register PMCR is architecturally mapped to External register PMCR_EL0.

Some or all RW fields of this register have defined reset values. These apply on Warm reset, and only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PMCR is a 32-bit register.

**Field descriptions**

The PMCR bit assignments are:
IMP, bits [31:24]
Implementer code. This field is RO with an IMPLEMENTATION DEFINED value.
The implementer codes are allocated by ARM. Values have the same interpretation as bits [31:24] of the MIDR.

IDCODE, bits [23:16]
Identification code. This field is RO with an IMPLEMENTATION DEFINED value.
Each implementer must maintain a list of identification codes that is specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

N, bits [15:11]
Number of event counters. If EL2 is supported, then in Non-secure EL1 and EL0, this field returns the value of HDCR.HPMN.
Otherwise, this field is RO with an IMPLEMENTATION DEFINED value that indicates the number of counters implemented.
The value of this field is the number of counters implemented, from 0b00000 for no counters to 0b11111 for 31 counters.
An implementation can implement only the Cycle Count Register, PMCCNTR. This is indicated by a value of 0b00000 for the N field.

Bits [10:7]
Reserved, RES0.

LC, bit [6]
Long cycle counter enable. Determines which PMCCNTR bit generates an overflow recorded by PMOVSR[31].
0 Cycle counter overflow on increment that changes PMCCNTR[31] from 1 to 0.
1 Cycle counter overflow on increment that changes PMCCNTR[63] from 1 to 0.
ARM deprecates use of PMCR.LC = 0.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

DP, bit [5]
Disable cycle counter when event counting is prohibited. The possible values of this bit are:
0 PMCCNTR, if enabled, counts when event counting is prohibited.
1 PMCCNTR does not count when event counting is prohibited.
Event counting is prohibited when ProfilingProhibited(IsSecure(),PSTATE.EL) == TRUE.
This bit is RW.
If EL3 is not implemented, this field is RES0.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.
X, bit [4]
Enable export of events in an **IMPLEMENTATION DEFINED** event stream. The possible values of this bit are:

0  Do not export events.
1  Export events where not prohibited.

This bit is used to permit events to be exported to another debug device, such as an **OPTIONAL** trace macrocell, over an event bus. If the implementation does not include such an event bus, this bit is RAZ/WI.

This bit does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE. If the implementation does not include an exported event stream, this bit is RAZ/WI. Otherwise this bit is RW.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

D, bit [3]
Clock divider. The possible values of this bit are:

0  When enabled, PMCCNTR counts every clock cycle.
1  When enabled, PMCCNTR counts once every 64 clock cycles.

This bit is RW.

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.
ARM deprecates use of PMCR.D = 1.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

C, bit [2]
Cycle counter reset. This bit is WO. The effects of writing to this bit are:

0  No action.
1  Reset PMCCNTR to zero.

This bit is always RAZ.

Resetting PMCCNTR does not clear the PMCCNTR overflow bit to 0.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.

P, bit [1]
Event counter reset. This bit is WO. The effects of writing to this bit are:

0  No action.
1  Reset all event counters accessible in the current EL, not including PMCCNTR, to zero.

This bit is always RAZ.

In Non-secure EL0 and EL1, if EL2 is implemented, a write of 1 to this bit does not reset event counters that HDCR.HPMN reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.
Resetting the event counters does not clear any overflow bits to 0.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.
E, bit [0]

Enable. The possible values of this bit are:

0       All counters, including PMCCNTR, are disabled.
1       All counters are enabled by PMCNTENSET.

This bit is RW.

If EL2 is implemented, this bit does not affect the operation of event counters that HDCR.HPMN reserves for EL2 use.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

Accessing the PMCR:

To access the PMCR:

MRC p15,0,<Rt>,c9,c12,0 ; Read PMCR into Rt
MCR p15,0,<Rt>,c9,c12,0 ; Write Rt to PMCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1100</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.4.8  PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

This register can be read at EL0 when PMUSERENR.EN or PMUSERENR.ER is set to 1, and can be written at EL0 when PMUSERENR.ER is set to 1.

PMEVCNTR<n> can also be accessed by using PMXEVCNTR with PMSELR.SEL set to n.

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a \texttt{NOP}.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if PMSELR.SEL, or PMSELR_EL0.SEL if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible counters
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see \textit{Synchronous exception prioritization for exceptions taken to AArch32 state} on page G1-3845 for exceptions taken to AArch32 state, and \textit{Synchronous exception prioritization} on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.

If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, and PMUSERENR.ER==0, PL0 read accesses to this register are trapped to Undefined mode.
If PMUSERENR.EN==0, PL0 write accesses to this register are trapped to Undefined mode.
If PMUSERENR_EL0.EN==0, PL0 write accesses to this register are trapped to EL1.
If PMUSERENR_EL0.ER==0, and PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register PMEVCNTR<n> is architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0.
AArch32 System register PMEVCNTR<n> is architecturally mapped to External register PMEVCNTR<n>_EL0.
On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PMEVCNTR<n> is a 32-bit register.

**Field descriptions**

The PMEVCNTR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:0 Event counter n</td>
<td>Value of event counter n, where n is the number of this register and is a number from 0 to 30.</td>
</tr>
</tbody>
</table>

**Accessing the PMEVCNTR<n>:**

To access the PMEVCNTR<n>:

MRC p15,0,<Rt>,c14,<CRm>,<opc2> ; Read PMEVCNTR<n> into Rt, where n is in the range 0 to 30
MCR p15,0,<Rt>,c14,<CRm>,<opc2> ; Write Rt to PMEVCNTR<n>, where n is in the range 0 to 30

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1110</td>
<td>10(n&lt;4:3&gt;)</td>
<td>(n&lt;2:0&gt;)</td>
</tr>
</tbody>
</table>
G6.4.9 PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

This register is accessible at EL0 when PMUSERENR.EN is set to 1.

PMEVTYPER<n> can also be accessed by using PMXEVTYPER with PMSELR_SEL set to n.

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVTYPER<n> are CONstrained UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if PMSELR_SEL, or PMSELR_EL0_SEL if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

Note

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible counters
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TPM=1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
- If MDCR_EL2.TPM=1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TPM=1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.
- If PMUSERENR.EN=0, PL0 accesses to this register are trapped to Undefined mode.
- If PMUSERENR_EL0.EN=0, PL0 accesses to this register are trapped to EL1.
Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMEVTYPER<\(n\)> is architecturally mapped to AArch64 System register PMEVTYPER<\(n\)> _EL0.

AArch32 System register PMEVTYPER<\(n\)> is architecturally mapped to External register PMEVTYPER<\(n\)> _EL0.

On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

PMEVTYPER<\(n\)> is a 32-bit register.

Field descriptions

The PMEVTYPER<\(n\)> bit assignments are:

P, bit [31]

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:
0  Count events in EL1.
1  Do not count events in EL1.

U, bit [30]

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:
0  Count events in EL0.
1  Do not count events in EL0.

NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted.
Otherwise, events in Non-secure EL1 are not counted.

NSU, bit [28]

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted.
Otherwise, events in Non-secure EL0 are not counted.
NSH, bit [27]
Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.
0  Do not count events in EL2.
1  Count events in EL2.

Bit [26]
Reserved, RES0.

MT, bit [25]
Multi-threading. If MPU.EL1.MT is set to 0, this bit is RES0. Otherwise valid values for this bit are:
0  Count events only on controlling PE.
1  Count events from any PE at the same level 0 affinity as this PE.

Note
Events from a different thread of a multi-threaded implementation are not Attributable to the thread counting the event.

Bits [24:10]
Reserved, RES0.

evtCount, bits [9:0]
Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>. Software must program this field with an event defined by the processor or a common event defined by the architecture.
If evtCount is programmed to an event that is reserved or not implemented, the behavior depends on the event type.
For common architectural and microarchitectural events:
• No events are counted.
• The value read back on evtCount is the value written.
For IMPLEMENTATION DEFINED events:
• It is UNPREDICTABLE what event, if any, is counted. UNPREDICTABLE in this case means the event must not expose privileged information.
• The value read back on evtCount is an UNKNOWN value with the same effect.
ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

Accessing the PMEVTYPEPER<n>:
To access the PMEVTYPEPER<n>:
MRC p15,0,<Rt>,c14, <CRm>,<opc2> ; Read PMEVTYPEPER<n> into Rt, where n is in the range 0 to 30
MCR p15,0,<Rt>,c14, <CRm>,<opc2> ; Write Rt to PMEVTYPEPER<n>, where n is in the range 0 to 30

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1110</td>
<td>11:n&lt;4:3&gt;</td>
<td>n&lt;2:0&gt;</td>
</tr>
</tbody>
</table>
G6.4.10 PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<n>. Reading the register shows which overflow interrupt requests are enabled.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMINTENCLR. See the description of the P<\text{<x>}> bit.

PMINTENCLR is used in conjunction with the PMINTENSET register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state*. Subject to the prioritization rules:

- If HDCR.TPM==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If HSTR.T9==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T9==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If MDCR_EL2.TPM==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TPM==1, PL1 and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register PMINTENCLR is architecturally mapped to AArch64 System register PMINTENCLR_EL1.
- AArch32 System register PMINTENCLR is architecturally mapped to External register PMINTENCLR_EL1.

On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PMINTENCLR is a 32-bit register.

**Field descriptions**

The PMINTENCLR bit assignments are:
C, bit [31]

PMCCNTR overflow interrupt request disable bit. Possible values are:

0  When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
1  When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

P<x>, bit [x], for x = 0 to 30

Event counter overflow interrupt request disable bit for PMEVCNTR<x>.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

Bits [30:N] are RAZ/WI.

Possible values are:

0  When read, means that the PMEVCNTR<x> event counter interrupt request is disabled. When written, has no effect.
1  When read, means that the PMEVCNTR<x> event counter interrupt request is enabled. When written, disables the PMEVCNTR<x> interrupt request.

**Accessing the PMINTENCLR:**

To access the PMINTENCLR:

```
MRC p15,0,<Rt>,c9,c14,2 ; Read PMINTENCLR into Rt
MCR p15,0,<Rt>,c9,c14,2 ; Write Rt to PMINTENCLR
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1110</td>
<td>010</td>
</tr>
</tbody>
</table>

```
G6.4.11 PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<\textit{n}>. Reading the register shows which overflow interrupt requests are enabled.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMINTENSET. See the description of the P\textless{x}\textgreater bit.

PMINTENSET is used in conjunction with the PMINTENCLR register.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TPM==1, Non-secure PL1 accesses to this register are trapped to Hyp mode.
- If HSTR.T9==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T9==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If MDCR_EL2.TPM==1, Non-secure PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TPM==1, PL1 and PL2 accesses to this register are trapped to EL3.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register PMINTENSET is architecturally mapped to AArch64 System register PMINTENSET_EL1.
- AArch32 System register PMINTENSET is architecturally mapped to External register PMINTENSET_EL1.

On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

PMINTENSET is a 32-bit register.

Field descriptions

The PMINTENSET bit assignments are:
C, bit [31]

PMCCNTR overflow interrupt request enable bit. Possible values are:
0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
1 When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

P<x>, bit [x], for x = 0 to 30

Event counter overflow interrupt request enable bit for PMEVCNTR<x>.
When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.
Bits [30:N] are RAZ/WI.
Possible values are:
0 When read, means that the PMEVCNTR<x> event counter interrupt request is disabled. When written, has no effect.
1 When read, means that the PMEVCNTR<x> event counter interrupt request is enabled. When written, enables the PMEVCNTR<x> interrupt request.

Accessing the PMINTENSET:

To access the PMINTENSET:

MRC p15,0,<Rt>,c9,c14,1 ; Read PMINTENSET into Rt
MCR p15,0,<Rt>,c9,c14,1 ; Write Rt to PMINTENSET

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1110</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.4.12 PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<$.> Writing to this register clears these bits.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMOVSR. See the description of the Px bit.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
- If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.
- If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.
- If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.
- If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register PMOVSR is architecturally mapped to AArch64 System register PMOVSCLR_EL0.
- AArch32 System register PMOVSR is architecturally mapped to External register PMOVSCLR_EL0.

On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PMOVSR is a 32-bit register.

**Field descriptions**

The PMOVSR bit assignments are:
C, bit [31]

PMCCNTR overflow bit. Possible values are:

0  When read, means the cycle counter has not overflowed. When written, has no effect.
1  When read, means the cycle counter has overflowed. When written, clears the overflow bit to 0.

PMCR.LC is used to control from which bit of PMCCNTR (bit 31 or bit 63) an overflow is detected.

P<x>, bit [x], for x = 0 to 30

Event counter overflow clear bit for PMEVCNTR<x>.
Bits [30:N] are RAZ/WI.
When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN.
Otherwise, N is the value in PMCR.N.
Possible values of each bit are:

0  When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.
1  When read, means that PMEVCNTR<x> has overflowed. When written, clears the PMEVCNTR<x> overflow bit to 0.

Accessing the PMOVSR:

To access the PMOVSR:

MRC p15,0,<Rt>,c9,c12,3 ; Read PMOVSR into Rt
MCR p15,0,<Rt>,c9,c12,3 ; Write Rt to PMOVSR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1100</td>
<td>011</td>
</tr>
</tbody>
</table>

G6.4.13 PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<x>.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMOVSSET. See the description of the Px bit.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
- If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.
- If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.
- If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode.
- If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMOVSSET is architecturally mapped to AArch64 System register PMOVSSET_EL0.

AArch32 System register PMOVSSET is architecturally mapped to External register PMOVSSET_EL0.

On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PMOVSSET is a 32-bit register.

**Field descriptions**

The PMOVSSET bit assignments are:
C, bit [31]

PMCCNTR overflow bit. Possible values are:

0  When read, means the cycle counter has not overflowed. When written, has no effect.
1  When read, means the cycle counter has overflowed. When written, sets the overflow bit to 1.

P<x>, bit [x], for x = 0 to 30

Event counter overflow set bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

Possible values are:

0  When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.
1  When read, means that PMEVCNTR<x> has overflowed. When written, sets the PMEVCNTR<x> overflow bit to 1.

Accessing the PMOVSSET:

To access the PMOVSSET:

MRC p15,0,<Rt>,c9,c14,3 ; Read PMOVSSET into Rt
MCR p15,0,<Rt>,c9,c14,3 ; Write Rt to PMOVSSET

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1110</td>
<td>011</td>
</tr>
</tbody>
</table>
G6.4.14 PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

Selects the current event counter PMEVCNTR<\text{x}> or the cycle counter, CCNT.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

PMSELR is used in conjunction with PMXEVTYPER to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with PMXEVNCNTR, to determine the value of a selected event counter.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, and PMUSERENR.ER==0, PL0 accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.ER==0, PL0 accesses to this register are trapped to EL1.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMSELR is architecturally mapped to AArch64 System register PMSELR_EL0.

On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

PMSELR is a 32-bit register.

Field descriptions

The PMSELR bit assignments are:
Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, PMEVCNTR<x>, where x is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTYPER or PMXEVCNTR occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR.SEL is 0b11111 it selects the cycle counter and:

• A read of the PMXEVTYPER returns the value of PMCCFILTR.
• A write of the PMXEVTYPER writes to PMCCFILTR.
• A read or write of PMXEV CNTR has CONSTRAINED UNPREDICTABLE effects, that can be one of the following:
  — Access to PMXEVCNTR is UNDEFINED.
  — Access to PMXEVCNTR behaves as a NOP.
  — Access to PMXEVCNTR behaves as if the register is RAZ/WI.
  — Access to PMXEVCNTR behaves as if the PMSELR.SEL field contains an UNKNOWN value.

If this field is set to a value greater than or equal to the number of implemented counters, but not equal to 31, the results of access to PMXEVTYPER or PMXEV CNTR are CONSTRAINED UNPREDICTABLE, and can be one of the following:

• Access to PMXEVTYPER or PMXEV CNTR is UNDEFINED.
• Access to PMXEVTYPER or PMXEV CNTR behaves as a NOP.
• Access to PMXEVTYPER or PMXEV CNTR behaves as if the register is RAZ/WI.
• Access to PMXEVTYPER or PMXEV CNTR behaves as if the PMSELR.SEL field contains an UNKNOWN value.
• Access to PMXEVTYPER or PMXEV CNTR behaves as if the PMSELR.SEL field contains 0b11111.

Accessing the PMSELR:

To access the PMSELR:

MRC p15,0,<Rt>,c9,c12,5 ; Read PMSELR into Rt
MCR p15,0,<Rt>,c9,c12,5 ; Write Rt to PMSELR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1100</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.4.15 PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of HDCR.HPMN can change the behavior of accesses to PMSWINC. See the description of the Px bit.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure PL0 and PL1 write accesses to this register are trapped to Hyp mode.

If HSTR.T9==1, Non-secure EL0 and EL1 write accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T9==1, Non-secure EL0 and EL1 write accesses to this register are trapped to EL2.

If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 write accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, PL0, PL1, and PL2 write accesses to this register are trapped to EL3.

If PMUSERENR.EN==0, and PMUSERENR.SW==0, PL0 write accesses to this register are trapped to Undefined mode.

If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.SW==0, PL0 write accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMSWINC is architecturally mapped to AArch64 System register PMSWINC_EL0.

AArch32 System register PMSWINC is architecturally mapped to External register PMSWINC_EL0.

**Attributes**

PMSWINC is a 32-bit register.

**Field descriptions**

The PMSWINC bit assignments are:
Bit [31]

Reserved, RES0.

P<x>, bit [x], for x = 0 to 30

Event counter software increment bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in HDCR.HPMN. Otherwise, N is the value in PMCR.N.

The effects of writing to this bit are:

0  No action. The write to this bit is ignored.
1  If PMEVCNTR<x> is enabled and configured to count the software increment event, increments PMEVCNTR<x> by 1. If PMEVCNTR<x> is disabled, or not configured to count the software increment event, the write to this bit is ignored.

Accessing the PMSWINC:

To access the PMSWINC:

MCR p15,0,<Rt>,c9,c12,4 ; Write Rt to PMSWINC

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1100</td>
<td>100</td>
</tr>
</tbody>
</table>
G6.4.16 PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

**Purpose**

Enables or disables User mode access to the Performance Monitors.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
- If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.
- If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
- If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMUSERENR is architecturally mapped to AArch64 System register PMUSERENR_EL0.

Some or all RW fields of this register have defined reset values. These apply on Warm reset, and only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

PMUSERENR is a 32-bit register.

**Field descriptions**

The PMUSERENR bit assignments are:
Bits [31:4]

Reserved, RES0.

ER, bit [3]

Event counter read trap control:
0   PL0 reads of the PMXEVCNTR and PMEVCNTR<\text{n}>, and PL0 read/write access to the PMSELR, are trapped to Undefined mode if PMUSERENR.EN is also 0.
1   PL0 reads of the PMXEVCNTR and PMEVCNTR<\text{n}>, and PL0 read/write access to the PMSELR, are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

CR, bit [2]

Cycle counter read trap control:
0   PL0 reads of the PMCCNTR are trapped to Undefined mode if PMUSERENR.EN is also 0.
1   PL0 reads of the PMCCNTR are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

SW, bit [1]

Software increment write trap control:
0   PL0 writes to the PMSWINC are trapped to Undefined mode if PMUSERENR.EN is also 0.
1   PL0 writes to the PMSWINC are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.

EN, bit [0]

Traps PL0 accesses to the Performance Monitors registers to Undefined mode:
0   PL0 accesses to the Performance Monitors registers are trapped to Undefined mode.
1   PL0 accesses to the Performance Monitors registers are not trapped to Undefined mode.

Software can access all PMU registers at PL0.

Note

- The PMUSERENR is register is always RO at EL0 and not trapped by this bit.
- PL0 cannot read or write PMINTENSET and PMINTENCLR.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Warm reset.
Accessing the PMUSERENR:

To access the PMUSERENR:

MRC p15,0,<Rt>,c9,c14,0 ; Read PMUSERENR into Rt
MCR p15,0,<Rt>,c9,c14,0 ; Write Rt to PMUSERENR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1110</td>
<td>000</td>
</tr>
</tbody>
</table>
### G6.4.17 PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, PMEVCNTR<\(n\)>. PMSELR.SEL determines which event counter is selected.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If PMSELR.SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR.SEL is 31.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if PMSELR.SEL, or PMSELR_EL0.SEL if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

**Note**

In an implementation that includes EL2, in Non-secure state at PL0 and PL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

The CONSTRAINED UNPREDICTABLE behavior applies:

- If PMSELR.SEL is larger than the number of implemented counters.
- In an implementation that includes EL2, in Non-secure PL1 and PL0 modes, if the value of PMSELR.SEL is greater than the number of accessible counters.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845](#) for exceptions taken to AArch32 state, and [Synchronous exception prioritization](#) on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:
If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.
If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3.
If PMUSERENR.EN==0, and PMUSERENR.ER==0, PL0 read accesses to this register are trapped to Undefined mode.
If PMUSERENR.EN==0, PL0 write accesses to this register are trapped to Undefined mode.
If PMUSERENR_EL0.EN==0, PL0 write accesses to this register are trapped to EL1.
If PMUSERENR_EL0.ER==0, and PMUSERENR_EL0.EN==0, PL0 read accesses to this register are trapped to EL1.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register PMXEVCNTR is architecturally mapped to AArch64 System register PMXEVCNTR_EL0.
On Warm reset, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

PMXEVCNTR is a 32-bit register.

Field descriptions

The PMXEVCNTR bit assignments are:

PMXEVCNTR<>, bits [31:0]
Value of the selected event counter, PMXEVCNTR<>, where x is the value stored in PMSELR.SEL.

Accessing the PMXEVCNTR:

To access the PMXEVCNTR:
MRC p15,0,<Rt>,c9,c13,2 ; Read PMXEVCNTR into Rt
MCR p15,0,<Rt>,c9,c13,2 ; Write Rt to PMXEVCNTR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1101</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.4.18 PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When PMSELR_SEL selects an event counter, this accesses a PMEVTYPER<n> register. When PMSELR_SEL selects the cycle counter, this accesses PMCCFILT.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If PMSELR_SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVTYPER are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR_SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR_SEL is 31.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if PMSELR_SEL, or PMSELR_EL0_SEL if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

Note

In an implementation that includes EL2, in Non-secure state at PL0 and PL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HDCR.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.
If HSTR.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T9==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.
If MDCR_EL2.TPM==1, Non-secure PL0 and PL1 accesses to this register are trapped to EL2.
If MDCR_EL3.TPM==1, PL0, PL1, and PL2 accesses to this register are trapped to EL3. If PMUSERENR.EN==0, PL0 accesses to this register are trapped to Undefined mode. If PMUSERENR_EL0.EN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states. AArch32 System register PMXEVTYPER is architecturally mapped to AArch64 System register PMXEVTYPER_EL0.

When the value of PMSELR.SEL is 31, to select the cycle counter, RW fields in this register have defined reset values that apply only when the PE resets into an Exception level that is using AArch32. See PMCCFILTR for the reset values.

Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN. This applies whenever PMSELR.SEL selects an event counter.

**Attributes**

PMXEVTYPER is a 32-bit register.

**Field descriptions**

The PMXEVTYPER bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Event type register or PMCCFILTR</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event type register or PMCCFILTR.

When PMSELR.SEL == 31, this register accesses PMCCFILTR.

Otherwise, this register accesses PMEVTYPER<n> where n is the value in PMSELR.SEL.

**Accessing the PMXEVTYPER:**

To access the PMXEVTYPER:

MRC p15,0,<Rt>,c9,c13,1 ; Read PMXEVTYPER into Rt
MCR p15,0,<Rt>,c9,c13,1 ; Write Rt to PMXEVTYPER

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1001</td>
<td>1101</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.5  Generic Timer registers

This section lists the Generic Timer registers in AArch32.
G6.5.1  CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

Purpose

Holds the clock frequency of the system counter.

Usage constraints

If EL1 is the highest exception level implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL2 is the highest exception level implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Can only be written at the highest Exception level implemented. For example, if EL3 is the highest implemented Exception level, CNTFRQ can only be written at EL3.

If EL3 is using AArch64, write access to CNTFRQ in AArch32 at Secure EL1 is UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If CNTKCTL.PL0PCTEN==0, and CNTKCTL.PL0VCTEN==0, PL0 read accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.EL0PCTEN==0, and CNTKCTL_EL1.EL0VCTEN==0, PL0 read accesses to this register are trapped to EL1.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTFRQ is architecturally mapped to AArch64 System register CNTFRQ_EL0.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.
Attributes

CNTFRQ is a 32-bit register.

Field descriptions

The CNTFRQ bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>...</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Clock frequency</td>
</tr>
</tbody>
</table>

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

Accessing the CNTFRQ:

To access the CNTFRQ:

MRC p15,0,<Rt>,c14,c0,0 ; Read CNTFRQ into Rt
MCR p15,0,<Rt>,c14,c0,0 ; Write Rt to CNTFRQ

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1110</td>
<td>0000</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.5.2 CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables

There are no traps or enables affecting this register.

Configurations

AArch32 System register CNTHCTL is architecturally mapped to AArch64 System register CNTHCTL_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

CNTHCTL is a 32-bit register.

Field descriptions

The CNTHCTL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8 7 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>EVNTI</td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.
EVNTI, bits [7:4]
Selects which bit (0 to 15) of the corresponding counter register (CNTPCT or CNTVCT) is the
trigger for the event stream generated from that counter, when that stream is enabled.
When this register has an architecturally-defined reset value, this field resets to a value that is
architecturally UNKNOWN.

EVNTDIR, bit [3]
Controls which transition of the counter register (CNTPCT or CNTVCT) trigger bit, defined by
EVNTI, generates an event when the event stream is enabled:
0 A 0 to 1 transition of the trigger bit triggers an event.
1 A 1 to 0 transition of the trigger bit triggers an event.
When this register has an architecturally-defined reset value, this field resets to a value that is
architecturally UNKNOWN.

EVNTEN, bit [2]
Enables the generation of an event stream from the corresponding counter:
0 Disables the event stream.
1 Enables the event stream.
When this register has an architecturally-defined reset value, this field resets to 0.

PL1PCEN, bit [1]
Traps Non-secure PL0 and PL1 accesses to the physical timer registers to Hyp mode.
0 Non-secure PL0 and PL1 accesses to the CNTP_CTL, CNTP_CVAL, and
   CNTP_TVAL are trapped to Hyp mode.
1 Non-secure PL0 and PL1 accesses to the CNTP_CTL, CNTP_CVAL, and
   CNTP_TVAL are not trapped to Hyp mode.
If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the
purpose of a direct read.
When this register has an architecturally-defined reset value, this field resets to 1.

PL1PCTEN, bit [0]
Traps Non-secure PL0 and PL1 accesses to the physical counter register to Hyp mode.
0 Non-secure PL0 and PL1 accesses to the CNTPCT are trapped to Hyp mode.
1 Non-secure PL0 and PL1 accesses to the CNTPCT are not trapped to Hyp mode.
If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the
purpose of a direct read.
When this register has an architecturally-defined reset value, this field resets to 1.

Accessing the CNTHCTL:
To access the CNTHCTL:

MRC p15,4,<Rt>,c14,c1,0 ; Read CNTHCTL into Rt
MCR p15,4,<Rt>,c14,c1,0 ; Write Rt to CNTHCTL

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>proc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1110</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.5.3  CNTHP_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP_CTL characteristics are:

**Purpose**
Control register for the Hyp mode physical timer.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**
There are no traps or enables affecting this register.

**Configurations**
AArch32 System register CNTHP_CTL is architecturally mapped to AArch64 System register CNTHP_CTL_EL2.
If EL2 is not implemented, this register is RES0 from EL3.
Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**
CNTHP_CTL is a 32-bit register.

**Field descriptions**
The CNTHP_CTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ENABLE | IMASK | ISTATUS |

**Bits [31:3]**
Reserved, RES0.

**ISTATUS, bit [2]**
The status of the timer. This bit indicates whether the timer condition is asserted:
0 Timer condition is not asserted.
1. Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see Operation of the CompareValue views of the timers on page D6-1897 and Operation of the TimerValue views of the timers on page D6-1898.

This bit is read-only.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

IMASK, bit [1]

Timer output signal mask bit. Permitted values are:

0  Timer output signal is not masked.
1  Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

ENABLE, bit [0]

Enables the timer. Permitted values are:

0  Timer disabled.
1  Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHP_TV AL continues to count down.

Note

Disabling the output signal might be a power-saving option.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the CNTHP_CTL:

To access the CNTHP_CTL:

MRC p15,4,<Rt>,c14,c2,1 ; Read CNTHP_CTL into Rt
MCR p15,4,<Rt>,c14,c2,1 ; Write Rt to CNTHP_CTL

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1110</td>
<td>0010</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.5.4 CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

**Purpose**

Holds the compare value for the Hyp mode physical timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch32 System register CNTHP_CVAL is architecturally mapped to AArch64 System register CNTHP_CVAL_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

CNTHP_CVAL is a 64-bit register.

**Field descriptions**

The CNTHP_CVAL bit assignments are:

```
63 62 51 40 39 28 17 16 5 4 3 2 1 0
```

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL2 physical timer compare value</td>
</tr>
</tbody>
</table>

**Accessing the CNTHP_CVAL:**

To access the CNTHP_CVAL:

MRRC p15,6,<Rt>,<Rt2>,c14 ; Read CNTHP_CVAL[31:0] into Rt and CNTHP_CVAL[63:32] into Rt2
MCRR p15,6,<Rt>,<Rt2>,c14 ; Write Rt to CNTHP_CVAL[31:0] and Rt2 to CNTHP_CVAL[63:32]
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0110</td>
<td>1110</td>
</tr>
</tbody>
</table>
G6.5.5  CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP_TVAL characteristics are:

Purpose

Holds the timer value for the Hyp mode physical timer.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

Where the value of CNTHP_CTL.ENABLE is 0:

- A write to CNTHP_TVAL updates the register
- The value held in CNTHP_TVAL continues to decrement
- A read of CNTHP_TVAL returns an UNKNOWN value.

Traps and Enables

There are no traps or enables affecting this register.

Configurations

AArch32 System register CNTHP_TVAL is architecturally mapped to AArch64 System register CNTHP_TVAL_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes

CNTHP_TVAL is a 32-bit register.

Field descriptions

The CNTHP_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL2 physical timer value</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:0]

EL2 physical timer value.

Accessing the CNTHP_TVAL:

To access the CNTHP_TVAL:
MRC p15,4,<Rt>,c14,c2,0 ; Read CNTHP_TVAL into Rt
MCR p15,4,<Rt>,c14,c2,0 ; Write Rt to CNTHP_TVAL

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1110</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>

CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTKCTL is architecturally mapped to AArch64 System register CNTKCTL_EL1.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

CNTKCTL is a 32-bit register.

**Field descriptions**

The CNTKCTL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>EVNTI</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:10]**

Reserved, RES0.
PL0PTEN, bit [9]
Traps PL0 accesses to the physical timer registers to Undefined mode.

0 PL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to Undefined mode.
1 PL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

PL0VTEN, bit [8]
Traps PL0 accesses to the virtual timer registers to Undefined mode.

0 PL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to Undefined mode.
1 PL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

EVNTI, bits [7:4]
Selects which bit (0 to 15) of the corresponding counter register (CNTPCT or CNTVCT) is the trigger for the event stream generated from that counter, when that stream is enabled.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

EVNTDIR, bit [3]
Controls which transition of the counter register (CNTPCT or CNTVCT) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0 A 0 to 1 transition of the trigger bit triggers an event.
1 A 1 to 0 transition of the trigger bit triggers an event.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

EVNTEN, bit [2]
Enables the generation of an event stream from the corresponding counter:

0 Disables the event stream.
1 Enables the event stream.

When this register has an architecturally-defined reset value, this field resets to 0.

PL0VCTEN, bit [1]
Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

0 PL0 accesses to the CNTVCT are trapped to Undefined mode.
1 PL0 accesses to the CNTFRQ and CNTVCT are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.

PL0PCTEN, bit [0]
Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

0 PL0 accesses to the CNTPCT are trapped to Undefined mode.
1 PL0 accesses to the CNTFRQ and CNTPCT are not trapped to Undefined mode.

When this register has an architecturally-defined reset value, this field resets to 0.
Accessing the CNTKCTL:

To access the CNTKCTL:

MRC p15,0,<Rt>,c14,c1,0 ; Read CNTKCTL into Rt
MCR p15,0,<Rt>,c14,c1,0 ; Write Rt to CNTKCTL

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1110</td>
<td>0001</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.5.7 CNTP_CTL, Counter-timer Physical Timer Control register

The CNTP_CTL characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

CNTP_CTL(S) is accessible as follows:

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

CNTP_CTL is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td></td>
<td></td>
<td></td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

CNTP_CTL(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td></td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

CNTP_CTL is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If CNTHCTL.PL1PCEN==0, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.

If CNTHCTL_EL2.EL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If CNTKCTL.PL0PTEN==0, PL0 accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.EL0PTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

AArch32 System register CNTP_CTL is architecturally mapped to AArch64 System register CNTP_CTL_EL0.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

CNTP_CTL is a 32-bit register.
Field descriptions

The CNTP_CTL bit assignments are:

```
<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>31</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>RES0</td>
<td>ISTATUS</td>
<td>IMASK</td>
</tr>
</tbody>
</table>
```

Bits [31:3] Reserved, RES0.

ISTATUS, bit [2]
The status of the timer. This bit indicates whether the timer condition is asserted:

- 0 Timer condition is not asserted.
- 1 Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see Operation of the CompareValue views of the timers on page D6-1897 and Operation of the TimerValue views of the timers on page D6-1898.

This bit is read-only.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

IMASK, bit [1] Timer output signal mask bit. Permitted values are:

- 0 Timer output signal is not masked.
- 1 Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

ENABLE, bit [0]
Enables the timer. Permitted values are:

- 0 Timer disabled.
- 1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TV continues to count down.

- **Note**
  Disabling the output signal might be a power-saving option.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the CNTP_CTL:

To access the CNTP_CTL:
MRC p15,0,<Rt>,c14,c2,1 ; Read CNTP_CTL into Rt
MCR p15,0,<Rt>,c14,c2,1 ; Write Rt to CNTP_CTL

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1110</td>
<td>0010</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.5.8 **CNTP_CVAL, Counter-timer Physical Timer CompareValue register**

The CNTP_CVAL characteristics are:

**Purpose**

Holds the compare value for the EL1 physical timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

CNTP_CVAL(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>Config-RW</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

CNTP_CVAL(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>-</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

CNTP_CVAL is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see "Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If CNTHCTL.PL1PCEN==0, Non-secure PL0 and PL1 accesses to this register are trapped to Hyp mode.

If CNTHCTL_EL2.PL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If CNTKCTL.PL0PTEN==0, PL0 accesses to this register are trapped to Undefined mode.

If CNTKCTL_EL1.PL0PTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

AArch32 System register CNTP_CVAL is architecturally mapped to AArch64 System register CNTP_CVAL_EL0.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

CNTP_CVAL is a 64-bit register.

**Field descriptions**

The CNTP_CVAL bit assignments are:
Bits [63:0]

EL1 physical timer compare value.

**Accessing the CNTP_CVAL:**

To access the CNTP_CVAL:

- `MRRC p15,2,<Rt>,<Rt2>,c14` ; Read CNTP_CVAL[31:0] into Rt and CNTP_CVAL[63:32] into Rt2
- `MCRR p15,2,<Rt>,<Rt2>,c14` ; Write Rt to CNTP_CVAL[31:0] and Rt2 to CNTP_CVAL[63:32]

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0010</td>
<td>1110</td>
</tr>
</tbody>
</table>
G6.5.9  **CNTP_TV AL, Counter-timer Physical Timer TimerValue register**

The CNTP_TV AL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer. This provides a 32-bit downcounter.

**Usage constraints**

If EL3 is implemented and is using AArch32, there are separate Secure and Non-secure instances of this register.

CNTP_TV AL(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>Config-RW</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

CNTP_TV AL(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>-</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, or is implemented and is using AArch64, there is a single instance of this register.

CNTP_TV AL is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Where the value of **CNTP_CTL.ENABLE** is 0:

- A write to CNTP_TV AL updates the register
- The value held in CNTP_TV AL continues to decrement
- A read of CNTP_TV AL returns an UNKNOWN value.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If **CNTKCTL.PL0PTEN==0**, PL0 accesses to this register are trapped to Undefined mode.

If **CNTKCTL_EL1.EL0PTEN==0**, EL0 accesses to this register are trapped to EL1.

If **CNTKCTL.PL0PTEN==0**, PL0 accesses to this register are trapped to Undefined mode.

If **CNTKCTL_EL1.EL0PTEN==0**, PL0 accesses to this register are trapped to EL1.

**Configurations**

AArch32 System register CNTP_TV AL is architecturally mapped to AArch64 System register CNTP_TV AL_EL0.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.
Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

The CNTP_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>EL1 physical timer value</td>
</tr>
</tbody>
</table>

Bits [31:0] EL1 physical timer value.

Accessing the CNTP_TVAL:

To access the CNTP_TVAL:

MRC p15, 0, <Rt>, c14, c2, 0 ; Read CNTP_TVAL into Rt
MCR p15, 0, <Rt>, c14, c2, 0 ; Write Rt to CNTP_TVAL

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1110</td>
<td>0010</td>
<td>000</td>
</tr>
</tbody>
</table>
**G6.5.10 CNTPCT, Counter-timer Physical Count register**

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

When CNTKCTL_EL0PCTEN is set to 1, if CNTPCT is accessible from EL1 in the current Security state then it is also accessible from EL0 in that Security state.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If CNTKCTL.PL1PCTEN==0, Non-secure PL0 and PL1 read accesses to this register are trapped to Hyp mode.
- If CNTKCTL_EL2.EL1PCTEN==0, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.
- If CNTKCTL.PL0PCTEN==0, PL0 read accesses to this register are trapped to Undefined mode.
- If CNTKCTL_EL1.EL0PCTEN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTPCT is architecturally mapped to AArch64 System register CNTPCT_EL0.

**Attributes**

CNTPCT is a 64-bit register.

**Field descriptions**

The CNTPCT bit assignments are:
Bits [63:0]

Physical count value.

**Accessing the CNTPCT:**

To access the CNTPCT:

```
MRRC p15,0,<Rt>,<Rt2>,c14 ; Read CNTPCT[31:0] into Rt and CNTPCT[63:32] into Rt2
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0000</td>
<td>1110</td>
</tr>
</tbody>
</table>
G6.5.11 CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

Purpose
Control register for the virtual timer.

Usage constraints
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Traps and Enables
For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:
If CNTKCTL.PL0VTEN==0, PL0 accesses to this register are trapped to Undefined mode.
If CNTKCTL_EL1.EL0VTEN==0, PL0 accesses to this register are trapped to EL1.

Configurations
There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register CNTV_CTL is architecturally mapped to AArch64 System register CNTV_CTL_EL0.
Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

Attributes
CNTV_CTL is a 32-bit register.

Field descriptions
The CNTV_CTL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>32</th>
<th>3 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td>ENABLE</td>
</tr>
</tbody>
</table>
Bits [31:3]
Reserved, RES0.

ISTATUS, bit [2]
The status of the timer. This bit indicates whether the timer condition is asserted:
0 Timer condition is not asserted.
1 Timer condition is asserted.
When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets
the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK
bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.
For more information see Operation of the CompareValue views of the timers on page D6-1897 and
Operation of the TimerValue views of the timers on page D6-1898.
This bit is read-only.
When this register has an architecturally-defined reset value, this field resets to a value that is
architecturally UNKNOWN.

IMASK, bit [1]
Timer output signal mask bit. Permitted values are:
0 Timer output signal is not masked.
1 Timer output signal is masked.
For more information, see the description of the ISTATUS bit.
When this register has an architecturally-defined reset value, this field resets to a value that is
architecturally UNKNOWN.

ENABLE, bit [0]
Enables the timer. Permitted values are:
0 Timer disabled.
1 Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from
CNTV_TV AL continues to count down.

Note
Disabling the output signal might be a power-saving option.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the CNTV_CTL:
To access the CNTV_CTL:
MRC p15,0,<Rt>,c14,c3,1 ; Read CNTV_CTL into Rt
MCR p15,0,<Rt>,c14,c3,1 ; Write Rt to CNTV_CTL
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1110</td>
<td>0011</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.5.12  CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

**Purpose**

Holds the compare value for the virtual timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If CNTKCTL.PLL0VTEN==0, PL0 accesses to this register are trapped to Undefined mode.
- If CNTKCTL_EL1.PLL0VTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTV_CVAL is architecturally mapped to AArch64 System register CNTV_CVAL_EL0.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

CNTV_CVAL is a 64-bit register.

**Field descriptions**

The CNTV_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual timer compare value</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the CNTV_CVAL:**

To access the CNTV_CVAL:
MRRC p15,3,<Rt>,<Rt2>,c14 ; Read CNTV_CVAL[31:0] into Rt and CNTV_CVAL[63:32] into Rt2
MCRR p15,3,<Rt>,<Rt2>,c14 ; Write Rt to CNTV_CVAL[31:0] and Rt2 to CNTV_CVAL[63:32]

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0011</td>
<td>1110</td>
</tr>
</tbody>
</table>
G6.5.13 CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Where the value of CNTV_CTL.ENABLE is 0:

- A write to CNTV_TVAL updates the register
- The value held in CNTV_TVAL continues to decrement
- A read of CNTV_TVAL returns an UNKNOWN value.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If CNTKCTL.PL0VTEN==0, PL0 accesses to this register are trapped to Undefined mode.
- If CNTKCTL_EL1.EL0VTEN==0, PL0 accesses to this register are trapped to EL1.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTV_TVAL is architecturally mapped to AArch64 System register CNTV_TVAL_EL0.

RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

The CNTV_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual timer value</td>
<td></td>
</tr>
</tbody>
</table>
Bits [31:0]

Virtual timer value.

**Accessing the CNTV_TVAL:**

To access the CNTV_TVAL:

MRC p15,0,<Rt>,c14,c3,0 ; Read CNTV_TVAL into Rt
MCR p15,0,<Rt>,c14,c3,0 ; Write Rt to CNTV_TVAL

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1110</td>
<td>0011</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.5.14 CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

**Purpose**
Holds the 64-bit virtual count value.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Config-RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If CNTKCTL.PL0VCTEN==0, PL0 read accesses to this register are trapped to Undefined mode.
- If CNTKCTL_EL1.EL0VCTEN==0, PL0 read accesses to this register are trapped to EL1.

**Configurations**
There is one instance of this register that is used in both Secure and Non-secure states.

- AArch32 System register CNTVCT is architecturally mapped to AArch64 System register CNTVCT_EL0.
- The virtual count value is equal to the physical count value visible in CNTPCT minus the virtual offset visible in CNTVOFF.
- When EL2 is not implemented, CNTVOFF is RES0, and the value of this register is the same as the value of CNTPCT.

**Attributes**
CNTVCT is a 64-bit register.

**Field descriptions**
The CNTVCT bit assignments are:

```
63 62  0

Virtual count value
```

Bits [63:0]
Virtual count value.
Accessing the CNTVCT:

To access the CNTVCT:

MRRC p15,1,<Rt>,<Rt2>,c14 ; Read CNTVCT[31:0] into Rt and CNTVCT[63:32] into Rt2

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0001</td>
<td>1110</td>
</tr>
</tbody>
</table>
G6.5.15  CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch32 System register CNTVOFF is architecturally mapped to AArch64 System register CNTVOFF_EL2.

If EL2 is not implemented, this register is RESO from EL3.

When EL2 is implemented and can use AArch32, on a reset into an Exception level that is using AArch32 this register resets to an IMPLEMENTATION DEFINED value that might be UNKNOWN.

**Attributes**

CNTVOFF is a 64-bit register.

**Field descriptions**

The CNTVOFF bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual offset</td>
</tr>
</tbody>
</table>

**Accessing the CNTVOFF:**

To access the CNTVOFF:

MRRC p15,4,<Rt>,-<Rt2>,c14 ; Read CNTVOFF[31:0] into Rt and CNTVOFF[63:32] into Rt2
MCRR p15,4,<Rt>,<Rt2>,c14 ; Write Rt to CNTVOFF[31:0] and Rt2 to CNTVOFF[63:32]
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0100</td>
<td>1110</td>
</tr>
</tbody>
</table>

G6.6 About the Generic Interrupt Controller (GIC) System registers

The ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 defines the full set of Generic Interrupt Controller (GIC) registers. These comprise:

- Memory-mapped registers, with register names prefixed by one of the following:
  - GICC, indicating a memory-mapped CPU interface register.
  - GICD, indicating a Distributor register.
  - GICH, indicating a memory-mapped virtual interface control register, typically accessed by a hypervisor.
  - GICR, indicating a Distributor register.
  - GICV, indicating a virtual CPU interface register.
  - GITS, indicating an ITS register.

- System registers, with register names prefixed by one of the following:
  - ICC, indicating a GIC CPU interface System register.
  - ICH, indicating a virtual interface control System register.

When implemented, the System registers defined by the GIC Architecture Specification form part of an ARM processor implementation, and therefore the definitions of these registers are duplicated in this Manual.

---

Note

The GIC System register descriptions published in the GIC Architecture Specification and those published in this Manual are derived from a single source. Document release dates indicate when the descriptions were imported from that source.

---

Some of the GIC System register descriptions include references to GIC memory-mapped registers. See the GIC Architecture Specification for more information about those registers.

The following sections describe the GIC System registers:
- Generic Interrupt Controller CPU interface System registers on page G6-4879.
- Generic Interrupt Controller Virtual interface control System registers on page G6-4940.
G6.7  Generic Interrupt Controller CPU interface System registers

See About the Generic Interrupt Controller (GIC) System registers on page G6-4878 for general information about the complete set of GIC registers, and about the subset of those registers that are described in this Manual.

This section describes the AArch32 GIC CPU interface System registers.
G6.7.1  **ICC_AP0R<n>, Interrupt Controller Active Priorities Group 0 Registers, n = 0 - 3**

The ICC_AP0R<n> characteristics are:

**Purpose**

Provides information about Group 0 active priorities.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when no interrupts are active) might cause the interrupt prioritization system to malfunction, causing:

- Interrupts that should pre-empt execution to not pre-empt execution.
- Interrupts that should not pre-empt execution to pre-empt execution.

ICC_AP0R1 is only implemented in implementations that support 6 or more bits of priority. ICC_AP0R2 and ICC_AP0R3 are only implemented in implementations that support 7 bits of priority. If an implementation that supports fewer bits of priority attempts to access these registers, it generates an Undefined Instruction exception.

Writing to the active priority registers in any order other than the following order might cause the interrupt prioritisation system to malfunction:

- ICC_AP0R<n>.
- Secure ICC_AP1R<n>.
- Non-secure ICC_AP1R<n>.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If \( \text{HSTR.T12} = 1 \), Non-secure EL1 accesses to this register are trapped to Hyp mode.

If \( \text{HSTR_EL2.T12} = 1 \), Non-secure EL1 accesses to this register are trapped to EL2.

If \( \text{ICH_HCR.TALL0} = 1 \), Non-secure EL1 accesses to this register are trapped to EL2.

If \( \text{ICH_HCR_EL2.TALL0} = 1 \), Non-secure EL1 accesses to this register are trapped to EL2.

If \( \text{ICC_HSRE.SRE} = 0 \), Non-secure EL1 and EL2 accesses to this register are UNDEFINED.

If \( \text{ICC_MSRE.SRE} = 0 \), EL1, EL2, and EL3 accesses to this register are UNDEFINED.

If \( \text{ICC_SRE.SRE} = 0 \), EL1 accesses to this register are UNDEFINED.

If \( \text{ICC_SRE_EL1.SRE} = 0 \), Non-secure EL1 and EL2 accesses to this register are UNDEFINED.

If \( \text{ICC_SRE_EL3.SRE} = 0 \), EL1, EL2, and EL3 accesses to this register are UNDEFINED.
Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_AP0R<n> is architecturally mapped to AArch64 System register ICC_AP0R<n>_EL1.

Attributes

ICC_AP0R<n> is a 32-bit register.

Field descriptions

The ICC_AP0R<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the ICC_AP0R<n>:

To access the ICC_AP0R<n>:

MRC p15,0,<Rt>,c12,c8,opc2 ; Read ICC_AP0R<n> into Rt, where n is in the range 0 to 3
MCR p15,0,<Rt>,c12,c8,opc2 ; Write Rt to ICC_AP0R<n>, where n is in the range 0 to 3

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1000</td>
<td>1:n&lt;1:0&gt;</td>
</tr>
</tbody>
</table>
G6.7.2  ICC_AP1R<n>, Interrupt Controller Active Priorities Group 1 Registers, n = 0 - 3

The ICC_AP1R<n> characteristics are:

**Purpose**

Provides information about Group 1 active priorities.

**Usage constraints**

ICC_AP1R<n>(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

ICC_AP1R<n>(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when no interrupts are active) might cause the interrupt prioritisation system to malfunction, causing:

- Interrupts that should pre-empt execution to not pre-empt execution.
- Interrupts that should not pre-empt execution to pre-empt execution.

ICC_AP1R1 is only implemented in implementations that support 6 or more bits of priority.

ICC_AP1R2 and ICC_AP1R3 are only implemented in implementations that support 7 bits of priority. If an implementation that supports fewer bits of priority attempts to access these registers, it generates an Undefined Instruction exception.

Writing to the active priority registers in any order other than the following order might cause the interrupt prioritisation system to malfunction:

- ICC_AP0R<n>.
- Secure ICC_AP1R<n>.
- Non-secure ICC_AP1R<n>.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

If ICH_HCR.TALL1==1, Non-secure EL1 accesses to this register are trapped to EL2.

If ICH_HCR_EL2.TALL1==1, Non-secure EL1 accesses to this register are trapped to EL2.

If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.

If ICC_MSRE.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.

If ICC_SRE.SRE==0, EL1 accesses to this register are UNDEFINED.

If ICC_SRE_EL1.SRE==0, EL1 accesses to this register are UNDEFINED.

If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.

If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.
Configurations

AArch32 System register ICC_AP1R<n>(S) is architecturally mapped to AArch64 System register ICC_AP1R<n>_EL1 (S).

AArch32 System register ICC_AP1R<n>(NS) is architecturally mapped to AArch64 System register ICC_AP1R<n>_EL1 (NS).

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Attributes

ICC_AP1R<n> is a 32-bit register.

Field descriptions

The ICC_AP1R<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the ICC_AP1R<n>:

To access the ICC_AP1R<n>:

MRC p15,0,<Rt>,c12,c9,opc2 ; Read ICC_AP1R<n> into Rt, where n is in the range 0 to 3
MCR p15,0,<Rt>,c12,c9,opc2 ; Write Rt to ICC_AP1R<n>, where n is in the range 0 to 3

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>

<td>0:n&lt;1:0&gt;</td>
</tr>
</tbody>
</table>
G6.7.3 ICC_ASGI1R, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC_ASGI1R characteristics are:

**Purpose**
Generates Group 1 SGIs for the Security state that is not the current Security state.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:
If HSTR.T12==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T12==1, Non-secure EL1 write accesses to this register are trapped to EL2.
If ICH_HCR.TC==1, Non-secure EL1 write accesses to this register are trapped to EL2.
If ICH_HCR_EL2.TC==1, Non-secure EL1 write accesses to this register are trapped to EL2.
If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
If ICC_MSRE.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.
If ICC_SRE.SRE==0, EL1 write accesses to this register are UNDEFINED.
If ICC_SRE_EL1.SRE==0, EL1 write accesses to this register are UNDEFINED.
If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.

**Configurations**
There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register ICC_ASGI1R performs the same function as AArch64 System operation ICC_ASGI1R_EL1.

**Attributes**
ICC_ASGI1R is a 64-bit register.

**Field descriptions**
The ICC_ASGI1R bit assignments are:
Bits [63:56]
Reserved, RES0.

Aff3, bits [55:48]
The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated. If the IRM bit is 1, this field is RES0.

Bits [47:41]
Reserved, RES0.

IRM, bit [40]
Interrupt Routing Mode. Determines how the generated interrupts should be distributed to PEs. Possible values are:
0 Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
1 Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]
The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated. If the IRM bit is 1, this field is RES0.

Bits [31:28]
Reserved, RES0.

INTID, bits [27:24]
The interrupt ID of the SGI.

Aff1, bits [23:16]
The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated. If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]
Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.
If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.
This restricts distribution of SGIs to the first 16 PEs of an affinity 1 cluster. If the IRM bit is 1, this field is RES0.

Accessing the ICC_ASGI1R:
To access the ICC_ASGI1R:
MCRR p15,1,<Rt>,<Rt2>,c12 ; Write Rt to ICC_ASGI1R[31:0] and Rt2 to ICC_ASGI1R[63:32]
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0001</td>
<td>1100</td>
</tr>
</tbody>
</table>
G6.7.4 ICC_BPR0, Interrupt Controller Binary Point Register 0

The ICC_BPR0 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

The minimum binary point value is IMPLEMENTATION DEFINED in the range:

- 0-3 if the implementation supports one Security state, and for the Secure copy of the register if the implementation supports two Security states.
- 1-4 for the Non-secure copy of the register.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICH_HCR.TALL0==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TALL0==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_BPR0 is architecturally mapped to AArch64 System register ICC_BPR0_EL1.

**Attributes**

ICC_BPR0 is a 32-bit register.
Field descriptions

The ICC_BPR0 bit assignments are:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[7:1]</td>
<td>[0]</td>
<td>gggggggg.s</td>
</tr>
<tr>
<td>1</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>ggggggg ss</td>
</tr>
<tr>
<td>2</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>gggggg.sss</td>

<tr>
<td>3</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>ggggg.sssss</td>
</tr>
<tr>
<td>4</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gg.sssssss</td>
</tr>
<tr>
<td>6</td>
<td>[7]</td>
<td>[6:0]</td>
<td>g.sssssssss</td>
</tr>
<tr>
<td>7</td>
<td>No preemption</td>
<td>[7:0]</td>
<td>sssssssss</td>
</tr>
</tbody>
</table>

Accessing the ICC_BPR0:

To access the ICC_BPR0:

MRC p15,0,<Rt>,c12,c8,3 ; Read ICC_BPR0 into Rt
MCR p15,0,<Rt>,c12,c8,3 ; Write Rt to ICC_BPR0

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1000</td>
<td>011</td>
</tr>
</tbody>
</table>
G6.7.5 ICC_BPR1, Interrupt Controller Binary Point Register 1

The ICC_BPR1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and
the subpriority field. The group priority field determines Group 1 interrupt preemption.

Usage constraints

ICC_BPR1(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RW</td>
<td></td>
</tr>
</tbody>
</table>

ICC_BPR1(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RW</td>
<td></td>
</tr>
</tbody>
</table>

The reset value is IMPLEMENTATION DEFINED, but is equal to:

- For the Secure copy of the register, the minimum value of ICC_BPR0.
- For the Non-secure copy of the register, the minimum value of ICC_BPR0 plus one.

An attempt to program the binary point field to a value less than the reset value sets the field to the
reset value.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception
prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to
AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to
AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
If ICH_HCR.TALL1==1, Non-secure EL1 accesses to this register are trapped to EL2.
If ICH_HCR_EL2.TALL1==1, Non-secure EL1 accesses to this register are trapped to EL2.
If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
If ICC_MSRE.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
If ICC_SRE.SRE==0, EL1 accesses to this register are UNDEFINED.
If ICC_SRE_EL1.SRE==0, EL1 accesses to this register are UNDEFINED.
If ICC_SRE_EL2.SRE==0, EL1 accesses to this register are UNDEFINED.
If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.

Configurations

AArch32 System register ICC_BPR1(S) is architecturally mapped to AArch64 System register
ICC_BPR1_EL1 (S).
AArch32 System register ICC_BPR1(NS) is architecturally mapped to AArch64 System register
ICC_BPR1_EL1 (NS).

In GIC implementations supporting two Security states, this register is Banked.

Attributes

ICC_BPR1 is a 32-bit register.
Field descriptions

The ICC_BPR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:3</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>2:0</td>
<td>BinaryPoint</td>
</tr>
</tbody>
</table>

Writing 0 to this field will instead set this field to its reset value, which is IMPLEMENTATION DEFINED and non-zero.

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>1</td>
<td>[7:1]</td>
<td>[0]</td>
<td>ggggggg.s</td>
</tr>
<tr>
<td>2</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>ggggg:ss</td>
</tr>
<tr>
<td>3</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>ggggg.sss</td>
</tr>
<tr>
<td>4</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>gggg.sssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssss</td>
</tr>
<tr>
<td>6</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gg.sssssss</td>
</tr>
<tr>
<td>7</td>
<td>[7]</td>
<td>[6:0]</td>
<td>g.sssssssss</td>
</tr>
</tbody>
</table>

Writing 0 to this field will instead set this field to its reset value, which is IMPLEMENTATION DEFINED and non-zero.

If EL3 is implemented and ICC_MCTLR.CBPR_EL1S is 1:
- Writing to this register at Secure EL1, or at EL3 not in Monitor mode, modifies ICC_BPR0.
- Reading this register at Secure EL1, or at EL3 not in Monitor mode, returns the value of ICC_BPR0.

If EL3 is implemented and ICC_MCTLR.CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO and SCR.IRQ:

<table>
<thead>
<tr>
<th>HCR.IMO</th>
<th>SCR.IRQ</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>Non-secure EL1 and EL2 accesses trap to EL3.</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.</td>
</tr>
</tbody>
</table>
If EL3 is not implemented and ICC_CTRLR.CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO:

<table>
<thead>
<tr>
<th>HCR.IMO</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.</td>
</tr>
<tr>
<td>1</td>
<td>Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.</td>
</tr>
</tbody>
</table>

**Accessing the ICC_BPR1:**

To access the ICC_BPR1:

MRC p15,0,<Rt>,c12,c12,3 ; Read ICC_BPR1 into Rt  
MCR p15,0,<Rt>,c12,c12,3 ; Write Rt to ICC_BPR1  

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1100</td>
<td>011</td>
</tr>
</tbody>
</table>
G6.7.6 ICC_CTLR, Interrupt Controller Control Register

The ICC_CTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Usage constraints

ICC_CTLR(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

ICC_CTLR(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
If ICH_HCR.TC==1, Non-secure EL1 accesses to this register are trapped to EL2.
If ICH_HCR_EL2.TC==1, Non-secure EL1 accesses to this register are trapped to EL2.
If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
If ICC_MSRE.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.
If ICC_SRE.SRE==0, EL1 accesses to this register are UNDEFINED.
If ICC_SRE_EL1.SRE==0, EL1 accesses to this register are UNDEFINED.
If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.

Configurations

AArch32 System register ICC_CTLR(S) is architecturally mapped to AArch64 System register ICC_CTLR_EL1 (S).
AArch32 System register ICC_CTLR(NS) is architecturally mapped to AArch64 System register ICC_CTLR_EL1 (NS).

Attributes

ICC_CTLR is a 32-bit register.

Field descriptions

The ICC_CTLR bit assignments are:
Reserved, RES0.

A3V, bit [15]
Affinity 3 Valid. Read-only and writes are ignored. Possible values are:
0 The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
1 The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

For virtual accesses:
• If EL2 is using AArch32, virtual accesses return the value from ICH_VTR.A3V.
• If EL2 is using AArch64, virtual accesses return the value from ICH_VTR_EL2.A3V.

For physical accesses:
• If EL3 is implemented and using AArch32, physical accesses return the value from ICC_MCTRL.A3V.
• If EL3 is implemented and using AArch64, physical accesses return the value from ICC_CTLR_EL3.A3V.
• If EL3 is not implemented, physical accesses return the value from this bit.

SEIS, bit [14]
SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:
0 The CPU interface logic does not support local generation of SEIs by the CPU interface.
1 The CPU interface logic supports local generation of SEIs by the CPU interface.

For virtual accesses:
• If EL2 is using AArch32, virtual accesses return the value from ICH_VTR.SEIS.
• If EL2 is using AArch64, virtual accesses return the value from ICH_VTR_EL2.SEIS.

For physical accesses:
• If EL3 is implemented and using AArch32, physical accesses return the value from ICC_MCTRL.SEIS.
• If EL3 is implemented and using AArch64, physical accesses return the value from ICC_CTLR_EL3.SEIS.
• If EL3 is not implemented, physical accesses return the value from this bit.

IDbits, bits [13:11]
Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:
000 16 bits.
PRI[10:8] bits

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports 2 Security states must implement at least 32 levels of physical priority (5 priority bits).
An implementation that supports only 1 Security state must implement at least 16 levels of physical priority (4 priority bits).

--- Note ---
This field always returns the number of bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1.

For virtual accesses:
- If EL2 is using AArch32, virtual accesses return the value from ICH_VTR.PRI[10:8]bits.
- If EL2 is using AArch64, virtual accesses return the value from ICH_VTR_EL2.PRI[10:8]bits.

For physical accesses:
- If EL3 is implemented and using AArch32, physical accesses return the value from ICC_MCTL.R.PRI[10:8]bits.
- If EL3 is implemented and using AArch64, physical accesses return the value from ICC_CTLR_EL3.PRI[10:8]bits.
- If EL3 is not implemented, physical accesses return the value from this field.

Bit [7]
Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

0 Disables use of ICC_PMR as a hint for interrupt distribution.
1 Enables use of ICC_PMR as a hint for interrupt distribution.

Virtual accesses to this bit return RES0.

For physical accesses:
- If EL3 is implemented:
  — If EL3 is using AArch32, this bit is an alias of ICC_MCTL.R.PMHE.
— If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.PMHE.
— If GICD_CTLR.DS == 0, this bit is read-only.
— If GICD_CTLR.DS == 1, this bit is read/write.

• If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:
  — If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
  — If this bit is read/write, it resets to zero.

**Bits [5:2]**

Reserved, RES0.

**EOImode, bit [1]**

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

0     ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
1     ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

For virtual accesses:
• If EL2 is using AArch32, virtual accesses modify ICH_VMCR.VEOIM.
• If EL2 is using AArch64, virtual accesses modify ICH_VMCR_EL2.VEOIM.

For physical accesses:
• If EL3 is implemented:
  — If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.
  — If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.
• If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:
  — If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
  — If this bit is read/write, it resets to zero.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

0     ICC_BPR0 determines the preemption group for Group 0 interrupts only.
     ICC_BPR1 determines the preemption group for Group 1 interrupts.
1     ICC_BPR0 determines the preemption group for both Group 0 and Group 1 interrupts.

For virtual accesses:
• If EL2 is using AArch32, virtual accesses modify ICH_VMCR.VCBPR.
• If EL2 is using AArch64, virtual accesses modify ICH_VMCR_EL2.VCBPR.

For physical accesses:
• If EL3 is implemented:
  — If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
— If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
— If GICD_CTLR.DS == 0, this bit is read-only.
— If GICD_CTLR.DS == 1, this bit is read/write.

• If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:
  — If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
  — If this bit is read/write, it resets to zero.

**Accessing the ICC_CTLR:**

To access the ICC_CTLR:

MRC p15,0,<Rt>,c12,c12,4 ; Read ICC_CTLR into Rt
MCR p15,0,<Rt>,c12,c12,4 ; Write Rt to ICC_CTLR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1100</td>
<td>100</td>
</tr>
</tbody>
</table>
G6.7.7 ICC_DIR, Interrupt Controller Deactivate Interrupt Register

The ICC_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T12==1, Non-secure EL1 write accesses to this register are trapped to EL2.
If ICH_HCR.TC==1, Non-secure EL1 write accesses to this register are trapped to EL2.
If ICH_HCR_EL2.TC==1, Non-secure EL1 write accesses to this register are trapped to EL2.
If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
If ICC_MSRE.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.
If ICC_SRE.SRE==0, EL1 write accesses to this register are UNDEFINED.
If ICC_SRE_EL1.SRE==0, EL1 write accesses to this register are UNDEFINED.
If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register ICC_DIR performs the same function as AArch64 System operation ICC_DIR_EL1.

Attributes

ICC_DIR is a 32-bit register.

Field descriptions

The ICC_DIR bit assignments are:
Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICC_DIR:**

To access the ICC_DIR:

MCR p15,0,<-Rt>,c12,c11,1 ; Write Rt to ICC_DIR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1011</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.7.8 ICC_EOIR0, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

A write to this register must correspond to the most recent valid read from an Interrupt Acknowledge Register. A valid read is a read that returns a valid INTID, that is not a special interrupt ID.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICH_HCR.TALL0==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TALL0==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_EOIR0 performs the same function as AArch64 System operation ICC_EOIR0_EL1.

**Attributes**

ICC_EOIR0 is a 32-bit register.

**Field descriptions**

The ICC_EOIR0 bit assignments are:
Reserved, RES0.

**INTID, bits [23:0]**

The interrupt ID from the corresponding ICC_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR.EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR.EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR.EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1NS.

**Accessing the ICC_EOIR0:**

To access the ICC_EOIR0:

MCR p15,0,<Rt>,c12,c8,1 ; Write Rt to ICC_EOIR0

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1000</td>
<td>001</td>
</tr>
</tbody>
</table>
G6.7.9 ICC_EOIR1, Interrupt Controller End Of Interrupt Register 1

The ICC_EOIR1 characteristics are:

**Purpose**
A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

A write to this register must correspond to the most recent valid read from an Interrupt Acknowledge Register. A valid read is a read that returns a valid INTID, that is not a special interrupt ID.

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:
- If HSTR.T12==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICH_HCR.TALL1==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TALL1==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.

**Configurations**
There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_EOIR1 performs the same function as AArch64 System operation ICC_EOIR1_EL1.

**Attributes**
ICC_EOIR1 is a 32-bit register.

**Field descriptions**
The ICC_EOIR1 bit assignments are:
Bits [31:24]  
Reserved, RES0.

INTID, bits [23:0]  
The interrupt ID from the corresponding ICC_IAR1 access.
This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.
If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.
If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.
The appropriate EOImode bit varies as follows:
• If EL3 is not implemented, the appropriate bit is ICC_CTLR.EOImode.
• If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOImode_EL3.
• If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
  — If the software is executing in Secure state, the bit is ICC_CTLR.EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1S.
  — If the software is executing in Non-secure state, the bit is ICC_CTLR.EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1NS.

Accessing the ICC_EOIR1:
To access the ICC_EOIR1:
MCR p15,0,<Rt>,c12,c12,1 ; Write Rt to ICC_EOIR1

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1100</td>
<td>001</td>
</tr>
</tbody>
</table>
### G6.7.10 ICC_HPPIR0, Interrupt Controller Highest Priority Pending Interrupt Register 0

The ICC_HPPIR0 characteristics are:

**Purpose**

Indicates the highest priority pending Group 0 interrupt on the CPU interface.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HISTR.T12==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HISTR_EL2.T12==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICH_HCR.TALL0==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TALL0==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_HPPIR0 is architecturally mapped to AArch64 System register ICC_HPPIR0_EL1.

**Attributes**

ICC_HPPIR0 is a 32-bit register.

**Field descriptions**

The ICC_HPPIR0 bit assignments are:
Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the highest priority pending interrupt, if that interrupt is observable at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs are:

1020 When the register is read in Monitor mode, indicates that the highest priority pending interrupt is of sufficient priority to be signaled, but it must be handled as a Secure Group 1 interrupt in a different Secure mode.

1021 When the register is read in Monitor mode, indicates that the highest priority pending interrupt is of sufficient priority to be signaled, but it is a Non-secure Group 1 interrupt that must be handled at Non-secure EL1 or EL2.

1023 Indicates that there is no pending interrupt, or the highest priority pending interrupt is not appropriate for the current Security state and Exception level, or not appropriate for this register.

An interrupt is not appropriate for this register if it is:

• A Group 1 interrupt, when this register is read while executing in a mode other than Monitor mode.
• A Secure interrupt, when this register is read while executing in Non-secure state.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing the ICC_HPPIR0:

To access the ICC_HPPIR0:

MRC p15,0,<Rt>,c12,c8,2 ; Read ICC_HPPIR0 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1000</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.7.11 ICC_HPPIR1, Interrupt Controller Highest Priority Pending Interrupt Register 1

The ICC_HPPIR1 characteristics are:

**Purpose**

Indicates the highest priority pending Group 1 interrupt on the CPU interface.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICH_HCR.TALL1==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TALL1==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_HPPIR1 is architecturally mapped to AArch64 System register ICC_HPPIR1_EL1.

**Attributes**

ICC_HPPIR1 is a 32-bit register.

**Field descriptions**

The ICC_HPPIR1 bit assignments are:
### Bits [31:24]

Reserved, RES0.

### INTID, bits [23:0]

The INTID of the highest priority pending interrupt, if that interrupt is observable at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs are:

- 1023 Indicates that there is no pending interrupt, or the highest priority pending interrupt is not appropriate for the current Security state and Exception level, or not appropriate for this register.

An interrupt is not appropriate for this register if it is:

- A Group 0 interrupt.
- A Secure interrupt, when this register is read while executing in Non-secure state.
- A Non-secure Group 1 interrupt, when this register is read while executing in a Secure non-Monitor mode if EL3 is using AArch32, or while executing at Secure EL1 if EL3 is using AArch64.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

### Accessing the ICC_HPPIR1:

To access the ICC_HPPIR1:

MRC p15,0,<Rt>,c12,c12,2 ; Read ICC_HPPIR1 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1100</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.7.12 ICC_HSRE, Interrupt Controller Hyp System Register Enable register

The ICC_HSRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_HSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state*. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

If ICC_MSRE.Enable==0, and ICC_MSRE.SRE==1, EL2 accesses to this register are trapped to EL3.

If ICC_SRE_EL3.Enable==0, and ICC_SRE_EL3.SRE==1, EL2 accesses to this register are trapped to EL3.

**Configurations**

AArch32 System register ICC_HSRE is architecturally mapped to AArch64 System register ICC_SRE_EL2.

**Attributes**

ICC_HSRE is a 32-bit register.

**Field descriptions**

The ICC_HSRE bit assignments are:
Bits [31:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE.

0  Non-secure EL1 accesses to ICC_SRE trap to EL2.
1  Non-secure EL1 accesses to ICC_SRE do not trap to EL2.

If ICC_HSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.
If ICC_HSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

When this register has an architecturally-defined reset value, this field resets to 0.

DIB, bit [2]

Disable IRQ bypass.

0  IRQ bypass enabled.
1  IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_MSRE.DIB.
If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read-write alias of ICC_MSRE.DIB.
In systems that do not support IRQ bypass, this bit is RAO/WI.

When this register has an architecturally-defined reset value, this field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

0  FIQ bypass enabled.
1  FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_MSRE.DFB.
If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read-write alias of ICC_MSRE.DFB.
In systems that do not support FIQ bypass, this bit is RAO/WI.

When this register has an architecturally-defined reset value, this field resets to 0.

SRE, bit [0]

System Register Enable.

0  The memory-mapped interface must be used. Access at EL2 or below to any ICH_* System register, or any EL1 or EL2 ICC_* register other than ICC_SRE or ICC_HSRE, results in an Undefined Instruction exception.
1  The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.
If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the ICC_HSRE:**

To access the ICC_HSRE:

```
MRC p15,4,<Rt>,c12,c9,5 ; Read ICC_HSRE into Rt
MCR p15,4,<Rt>,c12,c9,5 ; Write Rt to ICC_HSRE
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1100</td>
<td>1001</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.7.13  ICC_IAR0, Interrupt Controller Interrupt Acknowledge Register 0

The ICC_IAR0 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICH_HCR.TALL0==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TALL0==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_IAR0 is architecturally mapped to AArch64 System register ICC_IAR0_EL1.

**Attributes**

ICC_IAR0 is a 32-bit register.

**Field descriptions**

The ICC_IAR0 bit assignments are:
Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt cannot be acknowledged, this field contains a special INTID to indicate the reason. These special INTIDs are:

- 1020 When the register is read in Monitor mode, indicates that the highest priority pending interrupt is of sufficient priority to be signaled, but it must be handled as a Secure Group 1 interrupt in a different Secure mode.
- 1021 When the register is read in Monitor mode, indicates that the highest priority pending interrupt is of sufficient priority to be signaled, but it is a Non-secure Group 1 interrupt that must be handled at Non-secure EL1 or EL2.
- 1023 Indicates that there is no pending interrupt with sufficient priority to be signaled to the processor, or the highest priority pending interrupt is not appropriate for the current Security state and Exception level, or not appropriate for this register.

An interrupt is not appropriate for this register if it is:

- A Group 1 interrupt, when this register is read while executing in a mode other than Monitor mode.
- A Secure interrupt, when this register is read while executing in Non-secure state.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing the ICC_IAR0:

To access the ICC_IAR0:

MRC p15,0,<Rt>,c12,c8,0 ; Read ICC_IAR0 into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1000</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.7.14   ICC_IAR1, Interrupt Controller Interrupt Acknowledge Register 1

The ICC_IAR1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 1 interrupt. This read acts as
an acknowledge for the interrupt.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible
as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception
prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to
AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to
AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
If HSTR_EL2.T12==1, Non-secure EL1 read accesses to this register are trapped to EL2.
If ICH_HCR.TALL1==1, Non-secure EL1 read accesses to this register are trapped to EL2.
If ICH_HCR_EL2.TALL1==1, Non-secure EL1 read accesses to this register are trapped to EL2.
If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
If ICC_MSRE.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.
If ICC_SRE.SRE==0, EL1 read accesses to this register are UNDEFINED.
If ICC_SRE_EL1.SRE==0, EL1 read accesses to this register are UNDEFINED.
If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.
AArch32 System register ICC_IAR1 is architecturally mapped to AArch64 System register
ICC_IAR1_EL1.

Attributes

ICC_IAR1 is a 32-bit register.

Field descriptions

The ICC_IAR1 bit assignments are:
Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt cannot be acknowledged, this field contains a special INTID to indicate the reason. These special INTIDs are:

<table>
<thead>
<tr>
<th>INTID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1023</td>
<td>No pending interrupt with sufficient priority to be signaled to the processor, or the highest priority pending interrupt is not appropriate for the current Security state and Exception level, or not appropriate for this register.</td>
</tr>
</tbody>
</table>

An interrupt is not appropriate for this register if it is:

- A Group 0 interrupt.
- A Secure interrupt, when this register is read while executing in Non-secure state.
- A Non-secure Group 1 interrupt, when this register is read while executing in a Secure non-Monitor mode if EL3 is using AArch32, or while executing at Secure EL1 if EL3 is using AArch64.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing the ICC_IAR1:

To access the ICC_IAR1:

```
MRC p15,0,<Rt>,c12,c12,0 ; Read ICC_IAR1 into Rt
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1100</td>
<td>000</td>
</tr>
</tbody>
</table>
ICC_IGRPEN0, Interrupt Controller Interrupt Group 0 Enable register

The ICC_IGRPEN0 characteristics are:

**Purpose**

Controls whether Group 0 interrupts are enabled or not.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

The lowest Exception level at which this register can be accessed is governed by the Exception level to which FIQ is routed. This routing depends on SCR.FIQ, SCR.NS and HCR.FMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T1==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T1==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICH_HCR.TALL0==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TALL0==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, EL1 accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_IGRPEN0 is architecturally mapped to AArch64 System register ICC_IGRPEN0_EL1.

**Attributes**

ICC_IGRPEN0 is a 32-bit register.

**Field descriptions**

The ICC_IGRPEN0 bit assignments are:
Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 0 interrupts.

0  Group 0 interrupts are disabled.
1  Group 0 interrupts are enabled.

Virtual accesses to this register update ICH_VMCR.VENG0.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the ICC_IGRPEN0:

To access the ICC_IGRPEN0:

MRC p15,0,<Rt>,c12,c12,6 ; Read ICC_IGRPEN0 into Rt
MCR p15,0,<Rt>,c12,c12,6 ; Write Rt to ICC_IGRPEN0

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1100</td>
<td>110</td>
</tr>
</tbody>
</table>
G6.7.16 ICC_IGRPEN1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1 characteristics are:

**Purpose**

Controls whether Group 1 interrupts are enabled for the current Security state.

**Usage constraints**

ICC_IGRPEN1(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

ICC_IGRPEN1(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

The lowest Exception level at which this register can be accessed is governed by the Exception level to which IRQ is routed. This routing depends on SCR.IIRQ, SCR.NS and HCR.IMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state.* Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICH_HCR.TALL1==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TALL1==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.

**Configurations**

AArch32 System register ICC_IGRPEN1(S) is architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1 (S).

AArch32 System register ICC_IGRPEN1(NS) is architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1 (NS).

**Attributes**

ICC_IGRPEN1 is a 32-bit register.

**Field descriptions**

The ICC_IGRPEN1 bit assignments are:
Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

0  Group 1 interrupts are disabled for the current Security state.
1  Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update ICH_VMCR.VENG1.

If EL3 is present:

- This bit is a read/write alias of ICC_MGRPEN1.EnableGrp1{S, NS} as appropriate if EL3
  is using AArch32, or ICC_IGRPEN1_EL3.EnableGrp1{S, NS} as appropriate if EL3
  is using AArch64.
- When this register is accessed at EL3, the copy of this register appropriate to the current
  setting of SCR.NS is accessed.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the ICC_IGRPEN1:

To access the ICC_IGRPEN1:

MRC p15,0,<Rt>,c12,c12,7 ; Read ICC_IGRPEN1 into Rt
MCR p15,0,<Rt>,c12,c12,7 ; Write Rt to ICC_IGRPEN1

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1100</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.7.17 ICC_MCTLR, Interrupt Controller Monitor Control Register

The ICC_MCTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_MSRE.SRE==0, EL3 accesses to this register are UNDEFINED.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register ICC_MCTLR can be mapped to AArch64 System register ICC_CTLR_EL3, but this is not architecturally mandated.

**Attributes**

ICC_MCTLR is a 32-bit register.

**Field descriptions**

The ICC_MCTLR bit assignments are:
Bits [31:18]

Reserved, RES0.

nDS, bit [17]

Disable Security not supported. Possible values are:

0  The CPU interface logic supports disabling of security.
1  The CPU interface logic does not support disabling of security, and requires that security is not disabled.

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

0  The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.
1  The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.

Virtual accesses return the value from ICH_VTR.A3V.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

0  The CPU interface logic does not support generation of SEIs.
1  The CPU interface logic supports generation of SEIs.

Virtual accesses return the value from ICH_VTR.SEIS.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

000  16 bits.
001  24 bits.

All other values are reserved.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
Priorities, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports 2 Security states must implement at least 32 levels of physical priority (5 priority bits).
An implementation that supports only 1 Security state must implement at least 16 levels of physical priority (4 priority bits).

--- Note ---

This field always returns the number of bits implemented, regardless of the value of SCR.NS or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.
0 Disables use of the priority mask register as a hint for interrupt distribution.
1 Enables use of the priority mask register as a hint for interrupt distribution.

Software must write ICC_PMR to 0xFF before clearing this field to 0.
An implementation might choose to make this field RAO/WI.
When this register has an architecturally-defined reset value, this field resets to 0.

RM, bit [5]

SBZ.

--- Note ---

The equivalent bit in AArch64 is the Routing Modifier bit. This feature is not supported when EL3 is using AArch32.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

EOImode_ELINS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt:
0 ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
1 ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

EOImode_ELIS, bit [3]

EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt:
0 ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
1 ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**EOImode_EL3, bit [2]**
EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

- 0: ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
- 1: ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**CBPR_EL1NS, bit [1]**
Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1:

- 0: ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Non-Secure Group 1 interrupts.
- 1: ICC_BPR0 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1 access the state of ICC_BPR0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**CBPR_EL1S, bit [0]**
Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts in Secure non-Monitor modes:

- 0: ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Secure Group 1 interrupts.
- 1: ICC_BPR0 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure accesses to ICC_BPR1 access the state of ICC_BPR0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**Accessing the ICC_MCTLR:**

To access the ICC_MCTLR:

```
MRC p15,6,<Rt>,c12,c12,4 ; Read ICC_MCTLR into Rt
MCR p15,6,<Rt>,c12,c12,4 ; Write Rt to ICC_MCTLR
```

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>110</td>
<td>1100</td>
<td>1100</td>
<td>100</td>
</tr>
</tbody>
</table>
G6.7.18 ICC_MGRPEN1, Interrupt Controller Monitor Interrupt Group 1 Enable register

The ICC_MGRPEN1 characteristics are:

**Purpose**
Controls whether Group 1 interrupts are enabled or not.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

If an interrupt is pending within the CPU interface when an Enable bit becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:
- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR.EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_MSRE.SRE==0, EL3 accesses to this register are UNDEFINED.

**Configurations**
This register is only accessible in Secure state.

AArch32 System register ICC_MGRPEN1 can be mapped to AArch64 System register ICC_IGRPEN1_EL3, but this is not architecturally mandated.

**Attributes**
ICC_MGRPEN1 is a 32-bit register.

**Field descriptions**
The ICC_MGRPEN1 bit assignments are:
Bits [31:2]

Reserved, RES0.

EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

0 Secure Group 1 interrupts are disabled.
1 Secure Group 1 interrupts are enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

0 Non-secure Group 1 interrupts are disabled.
1 Non-secure Group 1 interrupts are enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the ICC_MGRPEN1:

To access the ICC_MGRPEN1:

MRC p15,6,<Rt>,c12,c12,7 ; Read ICC_MGRPEN1 into Rt
MCR p15,6,<Rt>,c12,c12,7 ; Write Rt to ICC_MGRPEN1

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>110</td>
<td>1100</td>
<td>1100</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.7.19 ICC_MSRE, Interrupt Controller Monitor System Register Enable register

The ICC_MSRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td></td>
</tr>
</tbody>
</table>

This register is always System register accessible.

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_MSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

**Configurations**

This register is only accessible in Secure state.

AArch32 System register ICC_MSRE can be mapped to AArch64 System register ICC_SRE_EL3, but this is not architecturally mandated.

**Attributes**

ICC_MSRE is a 32-bit register.

**Field descriptions**

The ICC_MSRE bit assignments are:
Bits [31:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE and ICC_HSRE.

0 Secure EL1 accesses to Secure ICC_SRE trap to EL3.
   EL2 accesses to Non-secure ICC_SRE and ICC_HSRE trap to EL3.
   Non-secure EL1 accesses to ICC_SRE trap to EL3, unless these accesses are trapped to
   EL2 as a result of ICC_MSRE.Enable == 0.

1 Secure EL1 accesses to Secure ICC_SRE do not trap to EL3.
   EL2 accesses to Non-secure ICC_SRE and ICC_HSRE do not trap to EL3.
   Non-secure EL1 accesses to ICC_SRE do not trap to EL3.

If ICC_MSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.
If ICC_MSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of
the bit.

When this register has an architecturally-defined reset value, this field resets to 0.

DIB, bit [2]

Disable IRQ bypass.

0 IRQ bypass enabled.
1 IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

When this register has an architecturally-defined reset value, this field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

0 FIQ bypass enabled.
1 FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

When this register has an architecturally-defined reset value, this field resets to 0.

SRE, bit [0]

System Register Enable.

0 The memory-mapped interface must be used. Access at EL3 or below to any ICH_*
   System register, or any EL1, EL2, or EL3 ICC_* register other than ICC_SRE,
   ICC_HSRE, or ICC_MSRE, results in an Undefined Instruction exception.

1 The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_*
   registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.
If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/W1.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the ICC_MSRE:**

To access the ICC_MSRE:

- `MRC p15,6,<Rt>,c12,c12,5` ; Read ICC_MSRE into Rt
- `MCR p15,6,<Rt>,c12,c12,5` ; Write Rt to ICC_MSRE

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>110</td>
<td>1100</td>
<td>1100</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.7.20 ICC_PMR, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMR characteristics are:

**Purpose**

Provides an interrupt priority filter. Only interrupts with higher priority than the value in this register are signaled to the PE.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RW</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If \text{ICH_HCR.TC}==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If \text{ICH_HCR_EL2.TC}==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If \text{ICC_HSRE.SRE}==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
- If \text{ICC_MSRE.SRE}==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.
- If \text{ICC_SRE.SRE}==0, EL1 accesses to this register are UNDEFINED.
- If \text{ICC_SRE_EL1.SRE}==0, EL1 accesses to this register are UNDEFINED.
- If \text{ICC_SRE_EL2.SRE}==0, Non-secure EL1 and EL2 accesses to this register are UNDEFINED.
- If \text{ICC_SRE_EL3.SRE}==0, EL1, EL2, and EL3 accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_PMR is architecturally mapped to AArch64 System register ICC_PMR_EL1.

**Attributes**

ICC_PMR is a 32-bit register.

**Field descriptions**

The ICC_PMR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Priority</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

<table>
<thead>
<tr>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xF8 (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>

Unimplemented priority bits are RAZ/WI.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the ICC_PMR:

To access the ICC_PMR:

MRC p15,0,<Rt>,c4,c6,0 ; Read ICC_PMR into Rt
MCR p15,0,<Rt>,c4,c6,0 ; Write Rt to ICC_PMR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>0100</td>
<td>0110</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.7.21   ICC_RPR, Interrupt Controller Running Priority Register

The ICC_RPR characteristics are:

**Purpose**

Indicates the Running priority of the CPU interface.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

If there are no active interrupts on the CPU interface, or all active interrupts have undergone priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICH_HCR.TC==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TC==1, Non-secure EL1 read accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 read accesses to this register are UNDEFINED.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_RPR is architecturally mapped to AArch64 System register ICC_RPR_EL1.

**Attributes**

ICC_RPR is a 32-bit register.

**Field descriptions**

The ICC_RPR bit assignments are:
Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

Accessing the ICC_RPR:

To access the ICC_RPR:

MRC p15, 0, <Rt>, c12, c11, 3 ; Read ICC_RPR into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1011</td>
<td>011</td>
</tr>
</tbody>
</table>
G6.7.22 ICC_SGI0R, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R characteristics are:

**Purpose**
Generates Secure Group 0 SGIs, including from the Non-secure state when permitted by GICR_NSACR.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:
- If HSTR.T12==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICH_HCR.TC==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TC==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.

**Configurations**
There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_SGI0R performs the same function as AArch64 System operation ICC_SGI0R_EL1.

**Attributes**
ICC_SGI0R is a 64-bit register.

**Field descriptions**
The ICC_SGI0R bit assignments are:
### ICC_SGI0R Register

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:56]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[55:48]</td>
<td>Affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated. If the IRM bit is 1, this field is RES0.</td>
</tr>
<tr>
<td>[47:41]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[40]</td>
<td>Interrupt Routing Mode. Determines how the generated interrupts should be distributed to PEs. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>0: Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td></td>
<td>1: Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
<tr>
<td>[39:32]</td>
<td>Affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated. If the IRM bit is 1, this field is RES0.</td>
</tr>
<tr>
<td>[31:28]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[27:24]</td>
<td>Interrupt ID of the SGI.</td>
</tr>
<tr>
<td>[23:16]</td>
<td>Affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated. If the IRM bit is 1, this field is RES0.</td>
</tr>
<tr>
<td>[15:0]</td>
<td>Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number. If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error. This restricts distribution of SGIs to the first 16 PEs of an affinity 1 cluster. If the IRM bit is 1, this field is RES0.</td>
</tr>
</tbody>
</table>

### Accessing the ICC_SGI0R:

To access the ICC_SGI0R:

```
MCRR p15,2,<Rt>,<Rt2>,c12 ; Write Rt to ICC_SGI0R[31:0] and Rt2 to ICC_SGI0R[63:32]
```
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0010</td>
<td>1100</td>
</tr>
</tbody>
</table>
G6.7.23 ICC_SGI1R, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC_SGI1R characteristics are:

**Purpose**
Generates Group 1 SGIs for the current Security state.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>WO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 write accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICH_HCR.TC==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICH_HCR_EL2.TC==1, Non-secure EL1 write accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.
- If ICC_SRE.SRE==0, EL1 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL1.SRE==0, EL1 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, Non-secure EL1 and EL2 write accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, EL1, EL2, and EL3 write accesses to this register are UNDEFINED.

**Configurations**
There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ICC_SGI1R performs the same function as AArch64 System operation ICC_SGI1R_EL1.

**Attributes**
ICC_SGI1R is a 64-bit register.

**Field descriptions**
The ICC_SGI1R bit assignments are:
Bits [63:56]
Reserved, RES0.

Aff3, bits [55:48]
The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

Bits [47:41]
Reserved, RES0.

IRM, bit [40]
Interrupt Routing Mode. Determines how the generated interrupts should be distributed to PEs.
Possible values are:
0    Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.\textless target list\rangle.
1    Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]
The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

Bits [31:28]
Reserved, RES0.

INTID, bits [27:24]
The interrupt ID of the SGI.

Aff1, bits [23:16]
The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]
Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.
If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

This restricts distribution of SGIs to the first 16 PEs of an affinity 1 cluster.
If the IRM bit is 1, this field is RES0.

Accessing the ICC_SGI1R:
To access the ICC_SGI1R:
\text{MCRR p15,0,\langle Rt\rangle,\langle Rt2\rangle,c12} ; Write Rt to ICC_SGI1R[31:0] and Rt2 to ICC_SGI1R[63:32]
Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRm</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>0000</td>
<td>1100</td>
</tr>
</tbody>
</table>
G6.7.24 ICC_SRE, Interrupt Controller System Register Enable register

The ICC_SRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL0 and EL1.

**Usage constraints**

ICC_SRE(S) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

ICC_SRE(NS) is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_SRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as *UNKNOWN*.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR.EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.Enable==0, and ICC_HSRE.SRE==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_MSRE.Enable==0, and ICC_MSRE.SRE==1, EL1 and EL2 accesses to this register are trapped to EL3.
- If ICC_SRE_EL2.Enable==0, and ICC_SRE_EL2.SRE==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_SRE_EL3.Enable==0, and ICC_SRE_EL3.SRE==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**

AArch32 System register ICC_SRE(S) is architecturally mapped to AArch64 System register ICC_SRE_EL1 (S).

AArch32 System register ICC_SRE(NS) is architecturally mapped to AArch64 System register ICC_SRE_EL1 (NS).

**Attributes**

ICC_SRE is a 32-bit register.
Field descriptions

The ICC_SRE bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 32 33 34</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>2</td>
<td>Disable IRQ bypass.</td>
</tr>
<tr>
<td>0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>1</td>
<td>IRQ bypass disabled.</td>
</tr>
<tr>
<td>1</td>
<td>Disable FIQ bypass.</td>
</tr>
<tr>
<td>0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and GICD_CTRLR.DS == 0, this field is a read-only alias of ICC_MSRE.DIB.

If EL3 is implemented and GICD_CTRLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_MSRE.DIB.

If EL3 is not implemented or GICD_CTRLR.DS == 1, and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

When this register has an architecturally-defined reset value, this field resets to 0.

SRE, bit [0]

System Register Enable.

0 | The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE results in an Undefined Instruction exception.

1 | The System register interface for the current Security state is enabled.

Virtual accesses modify ICH_VMCR.VSRE.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.
If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.
When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the ICC_SRE:**

To access the ICC_SRE:

MRC p15,0,<Rt>,c12,c12,5 ; Read ICC_SRE into Rt
MCR p15,0,<Rt>,c12,c12,5 ; Write Rt to ICC_SRE

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>000</td>
<td>1100</td>
<td>1100</td>
<td>101</td>
</tr>
</tbody>
</table>
G6.8  Generic Interrupt Controller Virtual interface control System registers

See About the Generic Interrupt Controller (GIC) System registers on page G6-4878 for general information about the complete set of GIC registers, and about the subset of those registers that are described in this Manual.

This section describes the AArch32 GIC Virtual interface control System registers.
### G6.8.1 ICH_AP0R<n>, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH_AP0R<n> characteristics are:

**Purpose**

Provides information about Group 0 active priorities for EL2.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td></td>
<td>RW</td>
</tr>
</tbody>
</table>

ICH_AP0R1 is only implemented in implementations that support 6 or more bits of priority. ICH_AP0R2 and ICH_AP0R3 are only implemented in implementations that support 7 bits of priority. If an implementation that supports fewer bits of priority attempts to access these registers, it generates an Undefined Instruction exception.

If an implementation supports fewer than 5 bits of priority, then bits [31:2\text{implemented bits}] of ICH_AP0R0 are RAZ/WI, and bits [2\text{implemented bits}-1:0] correspond to valid priority levels.

**Note**

When fewer than 8 bits of priority are implemented, the priority corresponding to the lowest possible implemented priority can never be activated, so a corresponding active priority bit might not be implemented.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

If ICC_HSRE.SRE==0, EL2 accesses to this register are UNDEFINED.

If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.

If ICC_SRE_EL2.SRE==0, EL2 accesses to this register are UNDEFINED.

If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.

**Configurations**

AArch32 System register ICH_AP0R<n> is architecturally mapped to AArch64 System register ICH_AP0R<n>._EL2.

**Attributes**

ICH_AP0R<n> is a 32-bit register.
Field descriptions

The ICH_AP0R<\text{n}> bit assignments are:

```
P<\text{x}>, \text{bit }[\text{x}], \text{for } \text{x} = 0 \text{ to } 31
```

Group 0 interrupt active priorities. Possible values of each bit are:

- 0: There is no Group 0 interrupt active at the priority corresponding to that bit.
- 1: There is a Group 0 interrupt active at the priority corresponding to that bit.

The correspondence between priorities and bits depends on the number of bits of priority that are implemented.

If 5 bits of priority are implemented (bits [7:3] of priority), then there are 32 priority groups, and the active state of these priorities are held in ICH_AP0R0 in the bits corresponding to Priority[7:3].

If 6 bits of priority are implemented (bits [7:2] of priority), then there are 64 priority groups, and:

- The active state of priorities 0 - 124 are held in ICH_AP0R0 in the bits corresponding to 0:Priority[6:2].
- The active state of priorities 128 - 252 are held in ICH_AP0R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of priority are implemented (bits [7:1] of priority), then there are 128 priority groups, and:

- The active state of priorities 0 - 62 are held in ICH_AP0R0 in the bits corresponding to 00:Priority[5:1].
- The active state of priorities 64 - 126 are held in ICH_AP0R1 in the bits corresponding to 01:Priority[5:1].
- The active state of priorities 128 - 190 are held in ICH_AP0R2 in the bits corresponding to 10:Priority[5:1].
- The active state of priorities 192 - 254 are held in ICH_AP0R3 in the bits corresponding to 11:Priority[5:1].

**Note**

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<\text{n}> and ICH_AP1R<\text{n}> might cause the interrupt prioritisation system for virtual interrupts to malfunction.
When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the ICH_AP0R<n>:**

To access the ICH_AP0R<n>:

MRC p15,4,<Rt>,c12,c8,<opc2> ; Read ICH_AP0R<n> into Rt, where n is in the range 0 to 3
MCR p15,4,<Rt>,c12,c8,<opc2> ; Write Rt to ICH_AP0R<n>, where n is in the range 0 to 3

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1100</td>
<td>1000</td>
<td>0:n&lt;1:0&gt;</td>
</tr>
</tbody>
</table>
G6.AArch32 System Register Descriptions

G6.8 Generic Interrupt Controller Virtual interface control System registers

G6.8.2 ICH_AP1R<n>, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH_AP1R<n> characteristics are:

Purpose

Provides information about Group 1 active priorities for EL2.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

ICH_AP1R1 is only implemented in implementations that support 6 or more bits of priority. ICH_AP1R2 and ICH_AP1R3 are only implemented in implementations that support 7 bits of priority. If an implementation that supports fewer bits of priority attempts to access these registers, it generates an Undefined Instruction exception.

If an implementation supports fewer than 5 bits of priority, then bits [31:2implemented bits] of ICH_AP1R0 are RAZ/WI, and bits [2implemented bits-1:0] correspond to valid priority levels.

--- Note ---

When fewer than 8 bits of priority are implemented, the priority corresponding to the lowest possible implemented priority can never be activated, so a corresponding active priority bit might not be implemented.

Traps and Enables

For a description of the prioritization of any generated exceptions, see Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845 for exceptions taken to AArch32 state, and Synchronous exception prioritization on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.

Configurations

AArch32 System register ICH_AP1R<n> is architecturally mapped to AArch64 System register ICH_AP1R<n>_EL2.

Attributes

ICH_AP1R<n> is a 32-bit register.
Field descriptions

The ICH_AP1R<n> bit assignments are:

P<x>, bit [x], for x = 0 to 31

Group 1 interrupt active priorities. Possible values of each bit are:

0  There is no Group 1 interrupt active at the priority corresponding to that bit.
1  There is a Group 1 interrupt active at the priority corresponding to that bit.

The correspondence between priorities and bits depends on the number of bits of priority that are implemented.

If 5 bits of priority are implemented (bits [7:3] of priority), then there are 32 priority groups, and the active state of these priorities are held in ICH_AP1R0 in the bits corresponding to Priority[7:3].

If 6 bits of priority are implemented (bits [7:2] of priority), then there are 64 priority groups, and:

- The active state of priorities 0 - 124 are held in ICH_AP1R0 in the bits corresponding to 0:Priority[6:2].
- The active state of priorities 128 - 252 are held in ICH_AP1R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of priority are implemented (bits [7:1] of priority), then there are 128 priority groups, and:

- The active state of priorities 0 - 62 are held in ICH_AP1R0 in the bits corresponding to 00:Priority[5:1].
- The active state of priorities 64 - 126 are held in ICH_AP1R1 in the bits corresponding to 01:Priority[5:1].
- The active state of priorities 128 - 190 are held in ICH_AP1R2 in the bits corresponding to 10:Priority[5:1].
- The active state of priorities 192 - 254 are held in ICH_AP1R3 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might cause the interrupt prioritisation system for virtual interrupts to malfunction.
When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the ICH_AP1R<n>:**

To access the ICH_AP1R<n>:

- MRC p15,4,<Rt>,c12,c9,<opc2> ; Read ICH_AP1R<n> into Rt, where n is in the range 0 to 3
- MCR p15,4,<Rt>,c12,c9,<opc2> ; Write Rt to ICH_AP1R<n>, where n is in the range 0 to 3

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1100</td>
<td>1001</td>
<td>0:n&lt;1:0&gt;</td>
</tr>
</tbody>
</table>
ICH_EISR, Interrupt Controller End of Interrupt Status Register

The ICH_EISR characteristics are:

**Purpose**

Indicates which List registers have outstanding EOI maintenance interrupts.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>RO</td>
<td>RO</td>
<td></td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

If ICC_HSRE.SRE==0, EL2 read accesses to this register are UNDEFINED.

If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 read accesses to this register are UNDEFINED.

If ICC_SRE_EL2.SRE==0, EL2 read accesses to this register are UNDEFINED.

If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 read accesses to this register are UNDEFINED.

**Configurations**

AArch32 System register ICH_EISR is architecturally mapped to AArch64 System register ICH_EISR_EL2.

**Attributes**

ICH_EISR is a 32-bit register.

**Field descriptions**

The ICH_EISR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Status&lt;(n)&gt;, bit ([n]) for (n = 0) to (15)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.
Status\(<n>\), bit [\(n\)], for \(n = 0\) to \(15\)

EOI maintenance interrupt status bit for List register \(<n>\):
0 List register \(<n>\), \(ICH\_LR<\!n>\), does not have an EOI maintenance interrupt.
1 List register \(<n>\), \(ICH\_LR<\!n>\), has an EOI maintenance interrupt that has not been handled.

For any \(ICH\_LR<\!n>\), the corresponding status bit is set to 1 if all of the following are true:
• \(ICH\_LRC<\!n>\).State is \(0b00\).
• \(ICH\_LRC<\!n>\).HW is 0.
• \(ICH\_LRC<\!n>\).EOI (bit [9]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the ICH_EISR:

To access the ICH_EISR:

\[
\text{MRC p15,4,\(<Rt>\),c12,c11,3 ; Read ICH_EISR into \(<Rt>\)}
\]

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1100</td>
<td>1011</td>
<td>011</td>
</tr>
</tbody>
</table>
G6.8.4 ICH_ELRSR, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR characteristics are:

**Purpose**
Indicates which List registers contain valid interrupts.

**Usage constraints**
If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, EL2 read accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, EL2 read accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 read accesses to this register are UNDEFINED.

**Configurations**
AArch32 System register ICH_ELRSR is architecturally mapped to AArch64 System register ICH_ELRSR_EL2.

**Attributes**
ICH_ELRSR is a 32-bit register.

**Field descriptions**
The ICH_ELRSR bit assignments are:

![Bit assignments](image)

**Bits [31:16]**
Reserved, RES0.
Status<\text{n}>, bit [n], for n = 0 to 15

Status bit for List register <\text{n}>, \text{ICH\_LR}<\text{n}>:

- \text{0} \quad \text{List register ICH\_LR}<\text{n}>\text{, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.}
- \text{1} \quad \text{List register ICH\_LR}<\text{n}>\text{ does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.}

For any List register <\text{n}>, the corresponding status bit is set to \text{1} if \text{ICH\_LRC}<\text{n}\.State is 0b00 and either \text{ICH\_LRC}<\text{n}\.HW is \text{1} or \text{ICH\_LRC}<\text{n}\.EOI (bit [9]) is \text{0}.

Accessing the ICH\_ELRSR:

To access the ICH\_ELRSR:

\text{MRC p15,4,<Rt>,c12,c11,5 ; Read ICH\_ELRSR into Rt}

Register access is encoded as follows:

#### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.

#### Configurations

AArch32 System register ICH_HCR is architecturally mapped to AArch64 System register ICH_HCR_EL2.

#### Attributes

ICH_HCR is a 32-bit register.

#### Field descriptions

The ICH_HCR bit assignments are:
EOIcount, bits [31:27]

Counts the number of EOs received that do not have a corresponding entry in the List registers. The virtual CPU interface increments this field automatically when a matching EOI is received.

EOIs that do not clear a bit in one of the Active Priorities registers, ICH_AP0R<n> and ICH_AP1R<n>, do not cause an increment.

Although not possible under correct operation, if an EOI occurs when the value of this field is 31, this field wraps to 0.

The maintenance interrupt is asserted whenever this field is non-zero and the LRENPIE bit is set to 1.

When this register has an architecturally-defined reset value, this field resets to 0.

Bits [26:14]

Reserved, RES0.

TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at Non-secure EL1.

0 Locally generated SEIs do not cause a trap to EL2.
1 Locally generated SEIs trap to EL2.

If ICH_VTR.SEIS is 0, this bit is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.

TALL1, bit [12]

Trap all Non-secure EL1 accesses to ICC_* System registers for Group 1 interrupts to EL2.

0 Non-Secure EL1 accesses to ICC_* registers for Group 1 interrupts proceed as normal.
1 Any Non-secure EL1 accesses to ICC_* registers for Group 1 interrupts trap to EL2.

When this register has an architecturally-defined reset value, this field resets to 0.

TALL0, bit [11]

Trap all Non-secure EL1 accesses to ICC_* System registers for Group 0 interrupts to EL2.

0 Non-Secure EL1 accesses to ICC_* registers for Group 0 interrupts proceed as normal.
1 Any Non-secure EL1 accesses to ICC_* registers for Group 0 interrupts trap to EL2.

When this register has an architecturally-defined reset value, this field resets to 0.
TC, bit [10]

Trap all Non-secure EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.
0 Non-secure EL1 accesses to common registers proceed as normal.
1 Any Non-secure EL1 accesses to common registers trap to EL2.

This affects accesses to ICC_SGI0R, ICC_SGI1R, ICC_ASGI1R, ICC_CTLR, ICC_DIR, ICC_PMR, and ICC_RPR.

When this register has an architecturally-defined reset value, this field resets to 0.

Bits [9:8]

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is disabled:
0 Maintenance interrupt disabled.
1 Maintenance interrupt signaled when ICH_VMCR.VENG1 is 0.

When this register has an architecturally-defined reset value, this field resets to 0.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is enabled:
0 Maintenance interrupt disabled.
1 Maintenance interrupt signaled when ICH_VMCR.VENG1 is 1.

When this register has an architecturally-defined reset value, this field resets to 0.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is disabled:
0 Maintenance interrupt disabled.
1 Maintenance interrupt signaled when ICH_VMCR.VENG0 is 0.

When this register has an architecturally-defined reset value, this field resets to 0.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is enabled:
0 Maintenance interrupt disabled.
1 Maintenance interrupt signaled when ICH_VMCR.VENG0 is 1.

When this register has an architecturally-defined reset value, this field resets to 0.

NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt while no pending interrupts are present in the List registers:
0 Maintenance interrupt disabled.
1 Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

When this register has an architecturally-defined reset value, this field resets to 0.
LRENPIE, bit [2]
List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:
0 Maintenance interrupt disabled.
1 Maintenance interrupt is asserted while the EOICount field is not 0.
When this register has an architecturally-defined reset value, this field resets to 0.

UIE, bit [1]
Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:
0 Maintenance interrupt disabled.
1 Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.
When this register has an architecturally-defined reset value, this field resets to 0.

En, bit [0]
Enable. Global enable bit for the virtual CPU interface:
0 Virtual CPU interface operation disabled.
1 Virtual CPU interface operation enabled.
When this field is set to 0:
• The virtual CPU interface does not signal any maintenance interrupts.
• The virtual CPU interface does not signal any virtual interrupts.
• A read of GICV_IAR or GICV_AIAR returns a spurious interrupt ID.
When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the ICH_HCR:
To access the ICH_HCR:

MRC p15,4,<Rt>,c12,c11,0 ; Read ICH_HCR into Rt
MCR p15,4,<Rt>,c12,c11,0 ; Write Rt to ICH_HCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1100</td>
<td>1011</td>
<td>000</td>
</tr>
</tbody>
</table>
G6.8.6 ICH_LRC<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LRC<n> characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

ICH_LR<n> and ICH_LRC<n> can be updated independently.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.

**Configurations**

AArch32 System register ICH_LRC<n> is architecturally mapped to AArch64 System register ICH_LR<n>_EL2[63:32].

**Attributes**

ICH_LRC<n> is a 32-bit register.

**Field descriptions**

The ICH_LRC<n> bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27</th>
<th>24 23</th>
<th>16 15</th>
<th>10 9</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>RES0</td>
<td>Priority</td>
<td>RES0</td>
<td>pINTID</td>
</tr>
</tbody>
</table>

**HW**

Group
State, bits [31:30]
The state of the interrupt:
- 00: Inactive
- 01: Pending
- 10: Active
- 11: Pending and active.

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the inactive state are ignored, except for the purpose of generating virtual maintenance interrupts. For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

When this register has an architecturally-defined reset value, this field resets to 0.

HW, bit [29]
Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the pINTID field indicates.

- 0: The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
- 1: The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical interrupt ID.

If ICH_VMCR.VEOIM is 0, this request corresponds to a write to ICC_EOIR0 or ICC_EOIR1. Otherwise, it corresponds to a write to ICC_DIR.

When this register has an architecturally-defined reset value, this field resets to 0.

Group, bit [28]
Indicates the group for this virtual interrupt.

- 0: This is a Group 0 virtual interrupt. ICH_VMCR.VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR.VENG0 enables signaling of this interrupt to the virtual machine.
- 1: This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR.VENG1 enables the signaling of this interrupt to the virtual machine.

If ICH_VMCR.VCBPR is 0, then ICC_BPR1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICC_BPR0 determines preemption.

When this register has an architecturally-defined reset value, this field resets to 0.

Bits [27:24]
Reserved, RES0.

Priority, bits [23:16]
The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit [16] up to bit [18]. The number of implemented bits can be discovered from ICH_VTR.PRIbits.

When this register has an architecturally-defined reset value, this field resets to 0.

Bits [15:10]
Reserved, RES0.

pINTID, bits [9:0]
Physical interrupt ID, for hardware interrupts.
When the HW bit is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- **Bit [9] EOI.** If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- **Bits [8:0] Reserved, RES0.**

When the HW bit is 1 (there is a corresponding physical interrupt):

- This field indicates the physical interrupt ID that the hypervisor forwards to the Distributor. This field is only required to implement enough bits to hold a valid value for the ID configuration. Any unused higher order bits are RES0.
- If the value of pINTID is 0-15 or 1020-1023, behavior is UNPREDICTABLE. If the value of pINTID is 16-31, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 10 bits of Physical ID are required, regardless of the number specified by ICC_CTLR.IDbits.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the ICH_LRC<n>:**

To access the ICH_LRC<n>:  

- **MRC p15,4,<Rt>,c12,<CRm>,<opc2> ; Read ICH_LRC<n> into Rt, where n is in the range 0 to 15**
- **MCR p15,4,<Rt>,c12,<CRm>,<opc2> ; Write Rt to ICH_LRC<n>, where n is in the range 0 to 15**

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1100</td>
<td>111:n&lt;3&gt;</td>
<td>n&lt;2:0&gt;</td>
</tr>
</tbody>
</table>
**G6.8.7 ICH_LR<n>, Interrupt Controller List Registers, n = 0 - 15**

The ICH_LR<n> characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

ICH_LR<n> and ICH_LRC<n> can be updated independently.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.

**Configurations**

AArch32 System register ICH_LR<n> is architecturally mapped to AArch64 System register ICH_LR<n>_EL2[31:0].

**Attributes**

ICH_LR<n> is a 32-bit register.

**Field descriptions**

The ICH_LR<n> bit assignments are:

- **vINTID**
  
  Virtual ID of the interrupt.
Software must ensure there is only a single valid entry for a given vINTID.
It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be
implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered
from ICH_VTR.IDbits.
When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the ICH_LR<n>:**

To access the ICH_LR<n>:

MRC p15,4,<Rt>,c12,<CRm>,<opc2> ; Read ICH_LR<n> into Rt, where n is in the range 0 to 15
MCR p15,4,<Rt>,c12,<CRm>,<opc2> ; Write Rt to ICH_LR<n>, where n is in the range 0 to 15

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>

<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-3845* for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If HSTR_EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.

If ICC_HSRE.SRE==0, EL2 read accesses to this register are UNDEFINED.

If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 read accesses to this register are UNDEFINED.

If ICC_SRE_EL2.SRE==0, EL2 read accesses to this register are UNDEFINED.

If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 read accesses to this register are UNDEFINED.

**Configurations**

AArch32 System register ICH_MISR is architecturally mapped to AArch64 System register ICH_MISR_EL2.

**Attributes**

ICH_MISR is a 32-bit register.

**Field descriptions**

The ICH_MISR bit assignments are:
<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>

**VGrp1D, bit [7]**
VM Group 1 Disabled.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>VM Group 1 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>1</td>
<td>VM Group 1 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when `ICH_HCR.VGrp1DIE` is 1 and `ICH_VMCR.VMGrp1En` is 0.

When this register has an architecturally-defined reset value, this field resets to 0.

**VGrp1E, bit [6]**
VM Group 1 Enabled.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>VM Group 1 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>1</td>
<td>VM Group 1 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when `ICH_HCR.VGrp1EIE` is 1 and `ICH_VMCR.VMGrp1En` is 1.

When this register has an architecturally-defined reset value, this field resets to 0.

**VGrp0D, bit [5]**
VM Group 0 Disabled.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>

- **VGrp0E**
- **VGrp0D**
- **VGrp1E**
- **VGrp1D**
- **NP**
- **U**

**Table:**
- **RES0**
1     No Pending maintenance interrupt asserted.
This maintenance interrupt is asserted when ICH_HCR.NPIE is 1 and no List register is in pending state.
When this register has an architecturally-defined reset value, this field resets to 0.

LRENP, bit [2]
List Register Entry Not Present.
0     List Register Entry Not Present maintenance interrupt not asserted.
1     List Register Entry Not Present maintenance interrupt asserted.
This maintenance interrupt is asserted when ICH_HCR.LRENPIE is 1 and ICH_HCR.EOIfcount is non-zero.
When this register has an architecturally-defined reset value, this field resets to 0.

U, bit [1]
Underflow.
0     Underflow maintenance interrupt not asserted.
1     Underflow maintenance interrupt asserted.
This maintenance interrupt is asserted when ICH_HCR.UIE is 1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding ICH_LRC<n>.State bits do not equal 0x0.
When this register has an architecturally-defined reset value, this field resets to 0.

EOI, bit [0]
End Of Interrupt.
0     End Of Interrupt maintenance interrupt not asserted.
1     End Of Interrupt maintenance interrupt asserted.
This maintenance interrupt is asserted when at least one bit in ICH_EISR is 1.
When this register has an architecturally-defined reset value, this field resets to 0.

Accessing the ICH_MISR:

To access the ICH_MISR:
MRC p15,4,<Rt>,c12,c11,2 ; Read ICH_MISR into Rt

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1100</td>
<td>1011</td>
<td>010</td>
</tr>
</tbody>
</table>
G6.8.9  **ICH_VMCR, Interrupt Controller Virtual Machine Control Register**

The ICH_VMCR characteristics are:

**Purpose**

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

**Usage constraints**

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RW</td>
<td>RW</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RW</td>
</tr>
</tbody>
</table>

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization* on page D1-1546 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.
- If HSTR.EL2.T12==1, Non-secure EL1 accesses to this register are trapped to EL2.
- If ICC_HSRE.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.
- If ICC_SRE_EL2.SRE==0, EL2 accesses to this register are UNDEFINED.
- If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 accesses to this register are UNDEFINED.

**Configurations**

AArch32 System register ICH_VMCR is architecturally mapped to AArch64 System register ICH_VMCR_EL2.

**Attributes**

ICH_VMCR is a 32-bit register.

**Field descriptions**

The ICH_VMCR bit assignments are:
VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

Visible to the virtual PE as ICC_PMR.Priority.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 1.

Visible to the virtual PE as ICC_BPR0.Binary_Point.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 0.

Visible to the virtual PE as ICC_BPR1.Binary_Point.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOImode. Possible values of this bit are:

- 0: A write of an INTID to ICC_EOIR0 or ICC_EOIR1 drops the priority of the interrupt with that INTID, and also deactivates that interrupt.
- 1: A write of an INTID to ICC_EOIR0 or ICC_EOIR1 only drops the priority of the interrupt with that INTID. Software must write to ICC_DIR to deactivate the interrupt.

Visible to the virtual PE as ICC_CTLR.EOImode.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

- 0: ICC_BPR1 determines the preemption group for Non-secure Group 1 interrupts.
- 1: ICC_BPR0 determines the preemption group for Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1 access the state of ICC_BPR0.

Visible to the virtual PE as ICC_CTLR.CBPR.
VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

0       Group 0 virtual interrupts are presented as virtual IRQs.
1       Group 0 virtual interrupts are presented as virtual FIQs.

Visible to the virtual PE as GICV_CTLR.FIQEn.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

0       If the highest priority pending interrupt is Group 1, a read of GICV_IAR or
        GICV_HPPIR returns an interrupt ID of 1022.
1       If the highest priority pending interrupt is Group 1, a read of GICV_IAR or
        GICV_HPPIR returns the interrupt ID of the corresponding interrupt.

Visible to the virtual PE as GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. ARM deprecates the use of this
field.

VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

0       Group 1 virtual interrupts are disabled.
1       Group 1 virtual interrupts are enabled.

Visible to the virtual PE as ICC_IGRPEN1.Enable.

VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

0       Group 0 virtual interrupts are disabled.
1       Group 0 virtual interrupts are enabled.

Visible to the virtual PE as ICC_IGRPEN0.Enable.

Accessing the ICH_VMCR:

To access the ICH_VMCR:

MRC p15,4,<Rt>,c12,c11,7 ; Read ICH_VMCR into Rt
MCR p15,4,<Rt>,c12,c11,7 ; Write Rt to ICH_VMCR

Register access is encoded as follows:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>100</td>
<td>1100</td>
<td>1011</td>
<td>111</td>
</tr>
</tbody>
</table>
G6.8.10 ICH_VTR, Interrupt Controller VGIC Type Register

The ICH_VTR characteristics are:

Purpose

Describes the number of implemented virtual priority bits and List registers.

Usage constraints

If EL3 is implemented and is using AArch32, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0 (NS)</th>
<th>EL0 (S)</th>
<th>EL1 (NS)</th>
<th>EL2 (NS)</th>
<th>EL3 (SCR.NS=1)</th>
<th>EL3 (SCR.NS=0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>RO</td>
<td>RO</td>
<td>-</td>
</tr>
</tbody>
</table>

If EL3 is not implemented or EL3 is implemented and is using AArch64, this register is accessible as follows:

<table>
<thead>
<tr>
<th>EL0</th>
<th>EL1</th>
<th>EL2 (NS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>RO</td>
</tr>
</tbody>
</table>

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-3845 for exceptions taken to AArch32 state, and *Synchronous exception prioritization on page D1-1546* for exceptions taken to AArch64 state. Subject to the prioritization rules:

If HSTR.T12==1, Non-secure EL1 accesses to this register are trapped to Hyp mode.

If ICC_HSRE.SRE==0, EL2 read accesses to this register are UNDEFINED.

If ICC_MSRE.SRE==0, Non-secure EL2 and EL3 read accesses to this register are UNDEFINED.

If ICC_SRE_EL2.SRE==0, EL2 read accesses to this register are UNDEFINED.

If ICC_SRE_EL3.SRE==0, Non-secure EL2 and EL3 read accesses to this register are UNDEFINED.

Configurations

AArch32 System register ICH_VTR is architecturally mapped to AArch64 System register ICH_VTR_EL2.

Attributes

ICH_VTR is a 32-bit register.

Field descriptions

The ICH_VTR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>29</th>
<th>28</th>
<th>26</th>
<th>25</th>
<th>23</th>
<th>22</th>
<th>21</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

SEIS

A3V

nV4
PRIbits, bits [31:29]
The number of virtual priority bits implemented, minus one.
An implementation must implement at least 32 levels of virtual priority (5 priority bits).

PREbits, bits [28:26]
The number of virtual preemption bits implemented, minus one.
An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

IDbits, bits [25:23]
The number of virtual interrupt identifier bits supported:
000 16 bits.
001 24 bits.
All other values are reserved.

SEIS, bit [22]
SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:
0 The virtual CPU interface logic does not support generation of SEIs.
1 The virtual CPU interface logic supports generation of SEIs.

A3V, bit [21]
Affinity 3 Valid. Possible values are:
0 The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
1 The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

nV4, bit [20]
GICv4 direct injection of virtual interrupts not supported. Possible values are:
0 The CPU interface logic supports direct injection of virtual interrupts.
1 The CPU interface logic does not support direct injection of virtual interrupts.

Bits [19:5]
Reserved, RES0.

ListRegs, bits [4:0]
The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

Accessing the ICH_VTR:
To access the ICH_VTR:
MRC p15,4,<Rt>,c12,c11,1 ; Read ICH_VTR into Rt

Part H
External Debug
This chapter introduces the external debug components of ARMv8. It contains the following sections:

- Introduction to external debug on page H1-4972.
- External debug on page H1-4973.

Note

For information about self-hosted debug, see Chapter D2 AArch64 Self-hosted Debug and Chapter G2 AArch32 Self-hosted Debug.
**H1.1 Introduction to external debug**

ARMv8 supports both:

**Self-hosted debug**

The PE itself hosts a debugger. That is, developers developing software to run on the PE use debugger software running on the same PE.

**External debug**

The debugger is external to the PE. The debugging might be either on-chip, for example in a second PE, or off-chip, for example a JTAG debugger. External debug is particularly useful for:

- Hardware bring-up. That is, debugging during development when a system is first powered up and not all of the software functionality is available.
- PEs that are deeply embedded inside systems.

To support external debug, the ARM architecture defines required features that are called *external debug features*.

---

**Note**

**Definition of a debugger**

When the description of external debug in this part of the manual describes a *debugger* as controlling external debug this might be a second on-chip PE or a processor in an off-chip device such as a JTAG debugger.
H1.2 External debug

The following halting debug events are available in ARMv8:

- **Halting Step debug event on page H3-5020:**
  - The debugger can use this resource to make the PE step through code one line at a time.

- **Halt Instruction debug event on page H3-5030:**
  - This might occur when software executes the Halting software breakpoint instruction, HLT.

- **Exception Catch debug event on page H3-5031:**
  - This can be programmed to occur on all entries to a given Exception level.

- **External Debug Request debug event on page H3-5034:**
  - An embedded cross-trigger can signal this debug event.

- **OS Unlock Catch debug event on page H3-5035:**
  - This might occur when the state of the OS Lock changes from locked to unlocked.

- **Reset Catch debug event on page H3-5036:**
  - This might occur when the PE exits reset state.

- **Software Access debug event on page H3-5037:**
  - This can be programmed to occur when software tries to access the Breakpoint Value registers, the Breakpoint Control registers, the Watchpoint value registers, or the Watchpoint Control registers. It caused a trap to Debug state.

Halting debug events allow an external debugger to halt the PE. Breakpoints and watchpoints can also halt the PE. The PE then enters Debug state. When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.

- The **Instruction Transfer Register**, ITR, passes instructions to the PE to execute in Debug state:
  - The ITR contains a single register, EDITR, and associated flow-control flags.

- The **Debug Communications Channel**, DCC, passes data between the PE and the debugger:
  - The DCC includes the data transfer registers, DTRRX and DTRTX, and associated flow-control flags.
  - Although the DCC is an essential part of Debug state operation, it can also be used in Non-debug state.

- The PE cannot service any interrupts in Debug state.

Chapter H2 Debug State describes Debug state in more detail.
Introduction to External Debug

H1.2 External debug
Chapter H2
Debug State

This chapter describes Debug state. It contains the following sections:

- About Debug state on page H2-4976.
- Halting the PE on debug events on page H2-4977.
- Entering Debug state on page H2-4984.
- Behavior in Debug state on page H2-4988.
- Exiting Debug state on page H2-5014.

--- Note ---
Table J11-1 on page J11-5816 disambiguates the general register references used in this chapter.
H2.1 About Debug state

In external debug, debug events allow an external debugger to halt the PE. The PE then enters Debug state. When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger.

The PE cannot service any interrupts in Debug state.
H2.2 Halting the PE on debug events

For details of debug events see Introduction to Halting debug events on page H3-5018 and Breakpoint and Watchpoint debug events on page H2-4978.

On a debug event, the PE must do one of the following:

- Enter Debug state.
- Pend the debug event.
- Generate a debug exception.
- Ignore the debug event.

This behavior depends on both:

- Whether halting is allowed by the current state of the debug authentication interface. See Halting allowed and halting prohibited.
- The type of debug event and the programming of the debug control registers.
  - See Halting debug events for all Halting debug events.
  - See Breakpoint and Watchpoint debug events on page H2-4978 for Breakpoint and Watchpoint debug events.

See also Other debug exceptions on page H2-4979.

This means that behavior can be UNPREDICTABLE if the conditions change. See Synchronization and Halting debug events on page H3-5038.

Summary of debug events and possible outcomes on page H3-5018 summarizes the possible outcomes of each type of debug event.

H2.2.1 Halting allowed and halting prohibited

Halting can be either allowed or prohibited:

- Halting is always prohibited in Debug state.
- Halting is always prohibited when DoubleLockStatus() == TRUE.
  - This means that OS Double Lock is locked, that is EDPSR.DLK == 1.
- Halting is also controlled by the IMPLEMENTATION DEFINED authentication interface, and is prohibited when either:
  - The PE is in Non-secure state and ExternalInvasiveDebugEnabled() == FALSE.
  - The PE is in Secure state and ExternalSecureInvasiveDebugEnabled() == FALSE.

--- Note ---

See Appendix J2 Recommended External Debug Interface for more information on these functions.

- Otherwise, halting is allowed.

See Pseudocode description of Halting on debug events on page H2-4983.

H2.2.2 Halting debug events

When a Halting debug event is generated, it causes entry to Debug state if both:

- Halting is allowed. See Halting allowed and halting prohibited.
- The Halting debug event is either:
  - A Halt Instruction debug event when Halting debug is enabled. This means that EDSCR.HDE == 1.
  - Not a Halt Instruction debug event.
### H2.2 Halting the PE on debug events

--- **Note** ---

- An Halt Instruction debug event is the only Halting debug event that relies on EDSCR.HDE == 1. This is to prevent malicious code from causing an entry Debug state. EDSCR.HDE == 0 on a Cold reset.
- Halting on Breakpoint and Watchpoint Software debug events is also controlled by EDSCR.HDE. See Breakpoint and Watchpoint debug events.
- EDSCR.HDE can be written by software when the OS Lock is locked. Privileged code can use SDCR.TDOSA and HDCR.TDOSA to trap writes to these registers.

If a Halting debug event does not generate entry to Debug state because the conditions listed in this section do not hold, then:

- If the Halting debug event is a Halt Instruction debug event, it generates an Undefined Instruction exception.
- If the Halting debug event is an Exception Catch debug event or a Software Access debug event, it is ignored.
- In all other cases the Halting debug event is pended, meaning that:
  - The pending Halting debug event is recorded in EDESR.
  - The pending Halting debug event is taken when halting is allowed. See Pending Halting debug events on page H3-5038.

Pending Halting debug events are discarded by a Cold reset. The debugger can also force a pending event to be dropped by writing to EDESR. Summary of actions from debug events on page H2-4982 summarizes the possible outcome for each type of Debug event.

--- **Note** ---

Halting debug events never generate Debug exceptions.

### H2.2.3 Breakpoint and Watchpoint debug events

A breakpoint or watchpoint generates an entry to Debug state if all of the following conditions hold:

- Halting debug is enabled, that is EDSCR.HDE == 1.
- Halting is allowed. See Halting allowed and halting prohibited on page H2-4977.
- The OS Lock is unlocked, that is OSLR.OSLK == 0.

The Address Mismatch breakpoint type is reserved when all of these conditions are met.

MDSCR_EL1.MDE or DBGDSCRext.MDBGen is ignored when determining whether to enter Debug state. A breakpoint or watchpoint that generates entry to Debug state is a Breakpoint or Watchpoint debug event and does not generate a debug exception.

A breakpoint or watchpoint that does not generate an entry to Debug state either:

- Generates a Breakpoint or Watchpoint exception.
- Is ignored.

--- **Note** ---

EDSCR.HDE is ignored when determining whether to generate a debug exception. The debug exception is suppressed only if the PE enters Debug state. This means that the use of Halting debug mode in Non-secure state does not affect the Exception model in Secure state.

See Chapter D2 AArch64 Self-hosted Debug, Chapter G2 AArch32 Self-hosted Debug, and the Note in Other debug exceptions on page H2-4979.
H2.2.4 Other debug exceptions

The following events never generate entry to Debug state:

- Software Breakpoint Instruction exceptions.
- Software Step exceptions.
- Vector Catch exceptions.

The behavior of these events is unchanged when Halting debug mode is enabled, that is when EDSCR.HDE == 1. This means that these events can do one of the following:

- They can generate a debug exception.
- They can be ignored.

For additional information, see Chapter D2 AArch64 Self-hosted Debug and Chapter G2 AArch32 Self-hosted Debug.

H2.2.5 Debug state entry and debug event prioritization

The architecture does not define when asynchronous Halting debug events are taken, and therefore the prioritization of asynchronous debug events is IMPLEMENTATION DEFINED.

Synchronous Halting debug events do have a priority order.

The following are synchronous Halting debug events:

- Halting Step debug event.
- Halt Instruction debug event.
- Exception Catch debug event.
- Software Access debug event.
- Reset Catch debug event.

Each of these synchronous Halting debug events is treated as a synchronous exception generated by an instruction, or by the taking of an exception or reset. That is, the synchronous Halting debug event must be taken before any subsequent instructions are executed. Reset Catch debug events must be taken before the PE executes the instruction at the reset vector.

Note

Reset Catch and Exception Catch debug events can be generated asynchronously, because they can result from an asynchronous exception. However, if halting is allowed after the asynchronous exception has been processed, the Reset Catch or Exception Catch debug event is taken synchronously.

The Halting Step debug event is generated by the instruction after the stepped instruction. Therefore, if the stepped instruction generates any other synchronous exceptions or debug events, these are taken first.

OS Unlock Catch debug events are always pended and taken asynchronously.

Halting Step debug events and Reset Catch debug events might be pended and taken asynchronously at a later time.

The following list shows how the events are prioritized, with -2 being the highest priority.

Note

The priority numbering is the same as the numbering for AArch64 synchronous exception priorities listed in Synchronous exception types, routing and priorities on page D1-1545. The Debug events in this section with a negative priority are a higher priority than any synchronous exception. The debug events with fractional priorities have a priority between two or more exceptions.
The priority for synchronous debug events is as follows:

-2  Reset Catch debug event. See Reset Catch debug event on page H3-5036.  
This debug event has a higher priority than the synchronous exceptions listed in Synchronous exception types, routing and priorities on page D1-1545.

-1  Exception Catch debug event. See Exception Catch debug event on page H3-5031.  
This debug event can be assigned one of two priorities. When it has a priority of -1, it has a higher priority than the synchronous exceptions listed in the Exception model. See Exception Catch debug event on page H3-5031.

0   Halting Step debug event. See Halting Step debug event on page H3-5020.  
This debug event has a higher priority than the synchronous exceptions listed in the Exception model.

1   Software Step debug event. See Software Step exceptions on page D2-1671.

1.5 Exception Catch debug event. See Exception Catch debug event on page H3-5031.  
This debug event can be assigned one of two priorities, -1 or 1.5. See Exception Catch debug event on page H3-5031.

2 - 3 These events are not debug events.

4  Breakpoint exception or debug event or Address Matching Vector Catch exception. See Breakpoint exceptions on page D2-1638, and Vector Catch exceptions on page G2-4009.  
These two debug events have the same priority.

5 - 13 These events are not debug events.

14 Halt Instruction debug event. See Halt Instruction debug event on page H3-5030.

15 - 19 These events are not debug events.

19.5 Software Access debug event. See Software Access debug event on page H3-5037.

20 - 21 These events are not debug events.

22 Watchpoint exception or debug event. See Watchpoint exceptions on page D2-1656 for exceptions taken from AArch64 state, or Watchpoint exceptions on page G2-3995 for exceptions taken from AArch32 state.

23 This event is not a debug event.

For Reset Catch debug events and Halting Step debug events the priorities listed in this section only apply when halting is allowed at the time the event is generated. This means that the event is taken synchronously and not pended.

The prioritization of asynchronous Halting debug events, including pending Halting debug events taken asynchronously, is IMPLEMENTATION DEFINED. See Taking Halting debug events asynchronously on page H3-5039.

For more information on the prioritization of exceptions see Synchronous exception types, routing and priorities on page D1-1545.
Breakpoint debug events and Vector Catch exception

An Address Matching Vector Catch exception has the same priority as a Breakpoint debug event. See Synchronous exception prioritization on page D1-1546.

The prioritization of these events is unchanged even if the breakpoint generates entry to Debug state instead of a Breakpoint exception. This means that if a single instruction generates both an Address Matching Vector Catch exception and a Breakpoint debug event, there is a CONstrained UNpredictable choice of:

- The PE entering Debug state due to the Breakpoint debug event.
- A Vector Catch exception.

This only applies if all of the following are true:

- Halting debug is enabled.
- Halting is allowed.
- The OS Lock is unlocked.

An Exception Trapping Vector Catch exception must be generated immediately following the exception that generated it. This means that it does not appear in the priority table.

H2.2.6 Forcing entry to Debug state

Entry to Debug state is normally precise, meaning that the PE cannot enter Debug state if it can neither complete nor abandon all currently executing instructions and leave the PE in a precise state.

A debugger can write a value of 1 to EDRCR.CBRRQ to allow imprecise entry to Debug state. An External Debug Request debug event must be pending before writing 1 to this bit. Support for this feature is OPTIONAL and it is IMPLEMENTATION DEFINED when it is effective at forcing entry to Debug state.

The PE ignores writes to this bit if either:

- External debugging is not enabled, meaning ExternalInvasiveDebugEnabled() == FALSE.
- Secure external debugging is not enabled, meaning ExternalSecureInvasiveDebugEnabled() == FALSE, and either:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented.

Example H2-1 shows how entry to Debug state can be forced.

---

Example H2-1 Forcing entry to Debug state

The debugger pends an External Debug Request debug event through the CTI to halt a program that has stopped responding. However, the memory system is not responding and a memory access instruction cannot complete. This means that Debug state cannot be entered precisely. The debugger writes a value of 1 to EDRCR.CBRRQ. The PE cancels all outstanding memory accesses and enters Debug state. As some instructions might not have completed correctly, entry to Debug state is imprecise.

When Debug state is entered imprecisely, all memory access instructions executed through the ITR have UNpredictable behavior. The value of all registers is UNKNOWN, but might be useful for diagnostic purposes.
### H2.2.7 Summary of actions from debug events

Table H2-1 on page H2-4982 shows the Software and Halting debug events. In Table H2-1 on page H2-4982 the columns have the following meaning:

**Debug event type**

This means the type of debug event where:

- **Other software**
  - Means one of:
    - *Software Step exceptions* on page D2-1671.
    - *Software Breakpoint Instruction exceptions* on page D2-1636.
    - *Vector Catch exceptions* on page D2-1670 for AArch64 state or *Vector Catch exceptions* on page G2-4009 for AArch32 state.

- **Other Halting**
  - Means one of the following:
    - *Halting Step debug event* on page H3-5020.
    - *External Debug Request debug event* on page H3-5034.
    - *Reset Catch debug event* on page H3-5036.
    - *OS Unlock Catch debug event* on page H3-5035.

Other debug events are referred to explicitly.

**Authentication**

This means halting is allowed by the IMPLEMENTATION DEFINED external authentication interface. It is the result of one of the following pseudocode functions:

- **In Secure state**: `ExternalSecureInvasiveDebugEnabled()`,
- **In Non-secure state**: `ExternalInvasiveDebugEnabled()`.

**DLK**

This is the value of `EDPRSR.DLK`. It indicates whether the OS Double Lock is locked, `DoubleLockStatus() == TRUE`.

**OSLK**

This is the value of `OSLSR.OSLK`. It indicates whether the OS Lock is locked.

**HDE**

This is the value of `EDSCR.HDE`. It indicates whether Halting debug is enabled.

The letter X in Table H2-1 indicates that the value can be either 0 or 1.

H2.2.8 Pseudocode description of Halting on debug events

The following pseudocode outlines the Halting(), Restarting(), HaltingAllowed(), and HaltOnBreakpointOrWatchpoint() functions.

```c
// Halted()
// ========
boolean Halted()
   return !(EDSCR.STATUS IN {'000001', '000010'}); // Halted

// Restarting()
// ============
boolean Restarting()
   return EDSCR.STATUS == '000001'; // Restarting

// HaltingAllowed()
// ================
// Returns TRUE if halting is currently allowed, FALSE if halting is prohibited.
boolean HaltingAllowed()
   if Halted() || DoubleLockStatus() then
      return FALSE;
   elsif IsSecure() then
      return ExternalSecureInvasiveDebugEnabled();
   else
      return ExternalInvasiveDebugEnabled();

// HaltOnBreakpointOrWatchpoint()
// ==============================
// Returns TRUE if the Breakpoint and Watchpoint debug events should be considered for Debug
// state entry, FALSE if they should be considered for a debug exception.
boolean HaltOnBreakpointOrWatchpoint()
   return HaltingAllowed() && EDSCR.HDE == '1' && OSLSR_EL1.OSLK == '0';
```

H2.3 Entering Debug state

On entry to Debug state the preferred restart address and PSTATE are saved in DLR and DSPSR. The PE remains in the mode and security state from which it entered Debug state.

If EDRCR.CBRRQ has a value of 0, entry to Debug state is precise. If EDRCR.CBRRQ has a value of 1, then imprecise entry to Debug state is permitted.

If a Watchpoint debug event causes an entry to Debug state, the address of the access that generated the Watchpoint debug event is recorded in EDWAR. See Determining the memory location that caused a Watchpoint exception on page D2-1663 for an exception taken from AArch64 state, or Determining the memory location that caused a Watchpoint exception on page G2-4001 for an exception taken from AArch32 state.

Other than the effect on PSTATE and EDSCR, entry to Debug state is not a Context synchronization operation. The effects of entry to Debug state on PSTATE and EDSCR are synchronized.

H2.3.1 Entering Debug state from AArch32 state

When entering Debug state from AArch32 state, the PE remains in AArch32 state. In AArch32 Debug state the PE executes T32 instructions, regardless of the values of PSTATE,T before entering Debug state.

To allow the debugger to determine the state of the PE, the current Execution state for all four Exception levels can be read from EDSCR.RW, and the current Exception level can be read from EDSCR.EL.

The current endianness state, PSTATE.E, is unchanged on entry to Debug state.

Note

- If EL1 is using AArch32 state, the current endianness state can differ from that indicated by SCTLR.EE.
- If EL2 is using AArch32 state, the current endianness state can differ from that indicated by HSCTLR.EE.
- On entry to Debug state from AArch32 state, PSTATE_SS is copied to DSPSR_SS, even though the PE remains in AArch32 state.

See also Effect of entering Debug state on PSTATE on page H2-4985.

H2.3.2 Effect of entering Debug state on DLR and DSPSR

DLR is set to the preferred restart address for the debug event, that depends on the event type. The value of PSTATE is saved in DSPSR. For entry to Debug state from AArch32 state, the values saved in DSPSR.IT are always correct for the preferred restart address.

For synchronous Halting debug events, the preferred restart address is the address of the instruction that generated the debug event.

For asynchronous Halting debug events, including pending Halting debug events taken asynchronously, the preferred restart address is the address of the first instruction that must be executed on exit from Debug state.

This means that:

- For Breakpoint and Watchpoint debug events, the preferred restart address is the same as the preferred return address for a debug exception, as described in Chapter D2 AArch64 Self-hosted Debug and Chapter G2 AArch32 Self-hosted Debug.
- For Halt Instruction debug events DLR is set to the address of the HLT instruction and DSPSR.IT is correct for the HLT instruction.
- For Software Access debug events, DLR is set to the address of the accessing instruction and DSPSR.IT is correct for this instruction.
- For Halting Step debug events taken synchronously, DLR and DSPSR are set as the ELR and SPSR would be set for a Software Step exception. This is usually the address of, and PSTATE for, the instruction after the one that was stepped.
• For Exception Catch debug events:
  — If the debug event is generated on taking an exception to a trapped Exception level, the DLR is set to
    the address of the exception vector the PE would have started fetching from. This is UNKNOWN if the
    VBAR for the Exception level has never been initialized. The DSPSR records the value of PSTATE
    after taking the exception. The exception catch occurs after the SPSR and the Link register are set, and
    the debugger can use these registers to determine where in the application program the exception
    occurred.

    — Note

    Depending on the target Exception level and Execution state for the exception, the Link register is one
    of ELR_EL1, ELR_EL2, ELR_EL3, ELR_hyp, or LR (R14).

    — If the debug event is generated on an exception return to a trapped Exception level, the DLR is set to
      the target address of the exception return and the DSPSR records the value of PSTATE after the
      exception return.

• Reset Catch debug events taken synchronously behave like Exception Catch debug events.

• For Reset Catch debug events and Exception Catch debug events generated on reset to a trapped Exception
  level, the DLR is set to the reset address and the DSPSR records the reset value of PSTATE.

• For pending Halting debug events and External Debug Request debug events, DLR is set to the address of
  the first instruction that must be executed on exit from Debug state and DSPSR.IT is correct for this
  instruction. See Pending Halting debug events on page H3-5038.

Normally DLR is aligned according to the instruction set state indicated in DSPSR. However, a debug event might
be taken at a point where the PC is not aligned.

H2.3.3 Effect of entering Debug state on system registers, the Event register, and exclusive monitors

Entering Debug state has no effect on system registers other than DLR and DSPSR. In particular, ESRs, FARs, and
FSRs are not updated on entering Debug state. SCR is unchanged, even when entering Debug state from EL3.

Entering Debug state has no architecturally-defined effect on the Event Register and exclusive monitors.

— Note

Entry to Debug state might set the Event Register or clear the exclusive monitors, or both. However, this is not a
requirement, and debuggers must not rely on any implementation specific behavior.

Unless otherwise described in this reference manual, instructions executed in Debug state have their
architecturally-defined effects on the system registers, the Event register, and exclusive monitors.

H2.3.4 Effect of entering Debug state on PSTATE

The effect of an entry to Debug state on PSTATE is described in Entering Debug state on page H2-4984 and
Entering Debug state from AArch32 state on page H2-4984.

PSTATE.ÆE, M, nRW, EL, SPÆ are unchanged on entry to Debug state.

PSTATE.IL is cleared to 0 on entry to Debug state, after being saved in DSPSR_EL0.

The other PSTATE fields are ignored and not observable in Debug state:

• PSTATE.ÆN, Z, C, V, Q, GEÆ are unchanged.

• PSTATE.ÆIT, T, SS, D, A, I, FÆ are set to UNKNOWN values, after being saved in DSPSR_EL0.

For more information see Process state (PSTATE) in Debug state on page H2-4988.
H2.3.5 Entering Debug state during loads and stores

The PE can enter Debug state during instructions that perform a sequence of memory accesses, as opposed to a single single-copy atomic access, because of a Watchpoint debug event. The effect of entering Debug state on such an instruction is the same as taking a Data Abort exception during such an instruction.

In addition, when executing in AArch64 state, the PE can enter Debug state during instructions that perform a sequence of memory accesses because of an External Debug Request debug event. The effect of entering Debug state on such an instruction is the same as taking an interrupt exception during such an instruction.

This applies to all memory types.

H2.3.6 Entering Debug state and Software Step

When Software Step is active, a debug event that causes entry to Debug state behaves like an exception taken to an Exception level above the debug target Exception level. That is:

- If the instruction that is stepped generates a synchronous debug event that causes entry to Debug state, or an asynchronous debug event is taken before the step completes, the PE enters Debug state with DSPSR.SS set to 1.
- A pending Halting debug event or an asynchronous debug event can be taken after the step has completed. In this case the PE enters Debug state with DSPSR.SS set to 0.

In addition:

- If the instruction that is stepped generates an exception trapped by an Exception Catch debug event, the PE enters Debug state at the exception vector with DSPSR.SS set to 0. This is because PSTATE.SS is set to 0 by taking the exception.
- If the PE is reset, PSTATE.SS is reset to 0. If the following debug events are enabled, the PE enters Debug state with DSPSR.SS set to 0:
  — Reset Catch debug event at the reset Exception level.
  — Exception Catch debug event at the reset Exception level.
  — Halting Step debug event.
- If Halting Step is also active, then Halting Step and Software Step operate in parallel and can both become active-pending. In this case Halting step has a higher priority than Software step. This means that the PE enters Debug state and DSPSR.SS is set to 0.

H2.3.7 Pseudocode description of entering Debug state

The following pseudocode shows the definition of the DebugHalt() function.

```plaintext
constant bits(6) DebugHalt_Breakpoint = '000111';
constant bits(6) DebugHalt_EDBGRQ = '010011';
constant bits(6) DebugHalt_Step_Normal = '011011';
constant bits(6) DebugHalt_Step_Exclusive = '011111';
constant bits(6) DebugHalt_OSUnlockCatch = '100011';
constant bits(6) DebugHalt_ResetCatch = '100111';
constant bits(6) DebugHalt_Watchpoint = '101011';
constant bits(6) DebugHalt_HaltInstruction = '101111';
constant bits(6) DebugHalt_SoftwareAccess = '110011';
constant bits(6) DebugHalt_ExceptionCatch = '110111';
constant bits(6) DebugHalt_Step_NoSyndrome = '111011';
```

The pseudocode for the UpdateEDSCRFields() function is as follows:

```plaintext
// UpdateEDSCRFields()
// ================
// Update EDSCR processor state fields
UpdateEDSCRFields()
```
if !Halted() then
    EDSCR.EL = '00';
    EDSCR.NS = bit UNKNOWN;
    EDSCR.RW = '1111';
else
    EDSCR.EL = PSTATE.EL;
    EDSCR.NS = if IsSecure() then '0' else '1';
    EDSCR.RW<1> = (if ELUsingAArch32(EL1) then '0' else '1');
    if PSTATE.EL != EL0 then
        EDSCR.RW<0> = EDSCR.RW<1>;
    else
        EDSCR.RW<0> = (if UsingAArch32() then '0' else '1');
    if !HaveEL(EL2) || (HaveEL(EL3) && SCR_GEN[].NS == '0') then
        EDSCR.RW<2> = EDSCR.RW<1>;
    else
        EDSCR.RW<2> = (if ELUsingAArch32(EL2) then '0' else '1');
    if !HaveEL(EL3) then
        EDSCR.RW<3> = EDSCR.RW<2>;
    else
        EDSCR.RW<3> = (if ELUsingAArch32(EL3) then '0' else '1');
    return;

The pseudocode for the Halt() function is as follows:

// Halt()
// ======

Halt(bits(6) reason)

    CTI_SignalEvent(CrossTriggerIn_CrossHalt); // Trigger other cores to halt
    DLR_EL0 = ThisInstrAddr();
    DSPSR_EL0 = GetPSRFromPSTATE();
    DSPSR_EL0.SS = PSTATE.SS; // Always save PSTATE.SS
    EDSCR.ITE = '1'; EDSCR.ITO = '0';
if IsSecure() then
    EDSCR.SDD = '0'; // If entered in Secure state, allow debug
elsif HaveEL(EL3) then
    EDSCR.SDD = (if ExternalSecureInvasiveDebugEnabled() then '0' else '1');
else
    assert EDSCR.SDD == '1'; // Otherwise EDSCR.SDD is RES1
    EDSCR.MA = '0';
// PSTATE.{SS,D,A,I,F} are not observable and ignored in Debug state, so behave as if
// UNKNOWN. PSTATE.{N,Z,C,V,Q,GE} are also not observable, but since these are not changed on
// exception entry, this function also leaves them unchanged. PSTATE.{E,M,nRW,EL,SP} are
// unchanged. PSTATE.IL is set to 0.
if UsingAArch32() then
    PSTATE.<SS,A,I,F> = bits(4) UNKNOWN;
    // In AArch32, all instructions are T32 and unconditional.
    PSTATE.IT = '00000000'; PSTATE.T = '1'; // PSTATE.J is RES0
else
    PSTATE.<SS,D,A,I,F> = bits(5) UNKNOWN;
    PSTATE.IL = '0';
StopInstructionPrefetchAndEnableITR();
EDSCR.STATUS = reason;  // Signal entered Debug state
UpdateEDSCRFields();  // Update EDSCR processor state flags.
return;
H2.4 Behavior in Debug state

Instructions are executed in Debug state from the Instruction Transfer Register, ITR. The debugger controls which instructions are executed in Debug state by writing the instructions to the External Debug Instruction Transfer register, EDITR. The Execution state of the PE determines which instruction set is executed:

• If the PE is in AArch64 state it executes A64 instructions.
• If the PE is in AArch32 state it executes T32 instructions.

The PE does not execute A32 instructions in Debug state.

Some instructions are available only in Debug state. See Debug state instructions, DCPS, DRPS, MRS, MSR on page H2-5003. In Non-debug state these instructions are UNDEFINED.

H2.4.1 Process state (PSTATE) in Debug state

PSTATE.{N, Z, V, GE, IT, C, SS, D, A, I, F} are all ignored in Debug state:

• There are no conditional instructions in Debug state.
• In AArch32 state, the PE only executes T32 instructions and PSTATE.IT is ignored.
• Asynchronous exceptions and debug events are ignored.
• Software step is inactive.

Instructions executed in Debug state indirectly read PSTATE.{IL, E, M, nRW, EL, SP} as they would in Non-debug state.

H2.4.2 Executing instructions in Debug state

The instructions executed in Debug state must be either A64 instructions or T32 instructions, depending on the current Execution state.

Each instruction falls into one of the following groups:

• Debug state instructions. These are instructions that are changed in Debug state. See A64 instructions that are changed in Debug state on page H2-4989 and T32 instructions that are changed in Debug state on page H2-4993.

• Instructions that are unchanged in Debug state. See A64 instructions that are unchanged in Debug state on page H2-4989 and T32 instructions that are unchanged in Debug state on page H2-4993.

• Instructions that are UNPREDICTABLE in Debug state. See A64 instructions that are UNPREDICTABLE in Debug state on page H2-4990 and T32 instructions that are UNPREDICTABLE in Debug state on page H2-4995.

All T32 instructions are treated as unconditional, regardless of PSTATE.IT. See Process state (PSTATE) in Debug state.

If EDSCR.SDD == 1 then an instruction executed in Non-secure state cannot cause entry into Secure state. See Security in Debug state on page H2-5001

Executing A64 instructions in Debug state

The following sections describe the behavior of the A64 instructions in Debug state:

• A64 instructions that are changed in Debug state on page H2-4989.
• A64 instructions that are unchanged in Debug state on page H2-4989.
• A64 instructions that are UNPREDICTABLE in Debug state on page H2-4990.
A64 instructions that are changed in Debug state

The following A64 instructions are defined in Debug state, but are UNDEFINED in Non-debug state:

- **DCPS**
  
  
  **Note**

  DCPS can be UNDEFINED in certain conditions in Debug state. See *DCPS* on page H2-5003.

- **DRPS**
- **MRS (DLR_EL0), MRS (DPSR_EL0), MSR (DLR_EL0), MSR (DPSR_EL0)**

For more information see *Debug state instructions, DCPS, DRPS, MRS, MSR* on page H2-5003.

A64 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state:

Any instruction that is UNDEFINED in Non-debug state

This list of instructions excludes:

- Any instruction listed in *A64 instructions that are changed in Debug state*.
- Any instruction listed in *A64 instructions that are UNPREDICTABLE in Debug state* on page H2-4990 that is UNDEFINED because an enable or disable bit is not RES0 or RES1

Instructions that move System or Special-purpose registers to or from a general-purpose register

This list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes PSTATE access instructions.

These instructions are:

- **MRS <special_reg>, MSR <special_reg>**
  
  **Note**

  This does not include NZCV, DAIF, DAIFSet, DAIFClr, SPSel, and CurrentEL.

- **MRS <system_reg>, MSR <system_reg>**

Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- **FMOV** (between a general-purpose register and a single-precision register).
- **FMOV** (between a general-purpose register and a double-precision register).
- **FMOV** (between a general-purpose register and a SIMD element).

SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- **INS** (from a general-purpose register to a SIMD element).
- **UMOV** (from a SIMD element to a general-purpose register).

Barriers

These instructions are:

- **ISB**.
- **DSB**.
- **DMB**.
Memory access instructions at various access sizes

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
  - Unscaled (9-bit signed) immediate offset.
  - Immediate (9-bit signed) post-indexed.
  - Immediate (9-bit signed) pre-indexed.
  - Unprivileged (9-bit signed).
- Not literal.
- One of the following types:
  - (Single) register.
  - Exclusive.
  - Exclusive pair.
  - Acquire/Release.
  - Acquire/Release Exclusive.
  - Acquire/Release Exclusive pair.
- 32-bit and 64-bit target register variants.

These instructions are:

- \texttt{LDR}, \texttt{LDRB}, \texttt{LDRH}, \texttt{LDRSB}, \texttt{LDRSH}, \texttt{LDRSW} (immediate, not literal).
- \texttt{LDUR}, \texttt{LDURB}, \texttt{LDURH}, \texttt{LDURSB}, \texttt{LDURSH}, \texttt{LDURSW} (immediate).
- \texttt{LDTR}, \texttt{LDTRB}, \texttt{LDTRH}, \texttt{LDTRSB}, \texttt{LDTRSH}, \texttt{LDTRSW} (immediate).
- \texttt{LDAR}, \texttt{LDARB}, \texttt{LDARH}, \texttt{LDX}, \texttt{LDXR}, \texttt{LDAXR}, \texttt{LDAXRH}.
- \texttt{LDXP}, \texttt{LDAXP}.
- \texttt{STR}, \texttt{STRB}, \texttt{STRH} (immediate).
- \texttt{STUR}, \texttt{STURB}, \texttt{STURH} (immediate).
- \texttt{STTR}, \texttt{STTRB}, \texttt{STTRH} (immediate).
- \texttt{STLR}, \texttt{STLRB}, \texttt{STLRH}, \texttt{STXR}, \texttt{STXRB}, \texttt{STXRH}, \texttt{STLXR}, \texttt{STLXRB}, \texttt{STLXRH}.
- \texttt{STXP}, \texttt{STLXP}.

Move immediate to general-purpose register

These instructions are:

- \texttt{MOVZ}, \texttt{MVPN}, \texttt{MOVX} (immediate).
- \texttt{MOV} (between a general-purpose register and the stack pointer).

Cache maintenance, Send Event, NOP, and Clear Exclusive

These instructions are:

- \texttt{IC}.
- \texttt{DC}.
- \texttt{TLBI}.
- \texttt{AT}.
- \texttt{SEV}, \texttt{SEVL}.
- \texttt{NOP} (no operation hint).
- \texttt{CLREX}.

\textbf{A64 instructions that are UNPREDICTABLE in Debug state}

This subsection describes all instruction not listed in either:

- \textit{A64 instructions that are changed in Debug state} on page H2-4989.
- \textit{A64 instructions that are unchanged in Debug state} on page H2-4989.
These instructions are **CONSTRAINED UNPREDICTABLE** in Debug state. In general, the permissible behaviors are:

- The instruction generates an Undefined Instruction exception.
- The instruction executes as a **NOP**.
- If the instruction reads the PC or PSTATE, it uses an **UNKNOWN** value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets **DLR_EL0** and **DSPSR_EL0** to **UNKNOWN** values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for A64 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed. An example of this is **COMP**.

**Exception-generating instructions**

These instructions are:

- **SVC**.
- **HVC**.
- **SMC**.
- **BRK**.
- **HLT**.

These instructions behave in one of the following ways:

- They are **UNDEFINED**.
- They execute as a **NOP**.
- **SVC** behaves as **DCPS1**.
- **HVC** behaves as **DCPS2**.
- **SMC** behaves as **DCPS3**.
- They generate the exception that the instruction would generate in Non-debug state. The exception is taken as described in *Exceptions in Debug state on page H2-5007*

**Note**

**SMC** must not generate a Secure Monitor Call exception from Non-secure state if **EDSCR.SDD** is set to **1**.

**Instructions that explicitly write to the PC (branches)**

These instructions are:

These instructions behave in one of the following ways:

- They are **UNDEFINED**.
- They execute as a **NOP**.
- They execute as in Non-debug state without branching and set **DSPSR_EL0** and **DLR_EL0** to **UNKNOWN** values.

**Exception return and related instructions**

These instructions are:

- **ERET**.

These instructions behave in one of the following ways:

- They are **UNDEFINED**.
- They execute as a **NOP**.
• They execute as in Non-debug state without branching. They set DSPSR_EL0 and DLR_EL0 to UNKNOWN values, and either:
  — Execute as DRPS instead of performing an exception return, using UNKNOWN SPSR values.
  — Not change the Exception level.

Instructions that explicitly modify PSTATE, other than DCPS and DRPS

These instructions are:
• MSR DAIFSet (immediate), MSR DAIFClr (immediate), MSR SPSel (immediate).
• MSR NZCV (register), MSR DAIF (register), MSR SPSel (register).

These instructions behave in one of the following ways:
• They are UNDEFINED.
• They execute as a NOP.
• They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

Instructions that suspend execution

These instructions are:
• WFE, WFI

These instructions behave in one of the following ways:
• Are UNDEFINED.
• Execute as a NOP.
• Generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See Configurable instruction enables and disables, and trap controls on page D1-1558.

Note
This means that these instructions must not suspend execution.

Instructions that read the PC

These instructions are:
• LDR (literal), LDRSW (literal).
• ADR, ADRP.
• PRFM (literal).

These instructions behave in one of the following ways:
• They are UNDEFINED.
• They execute as a NOP.
• They execute as in Non-debug state, using an UNKNOWN value for the PC operand.

Instructions that read the PSTATE.{N, Z, C, V} or other PSTATE fields

These instructions are:
• CSEL, CSINC, CSINV, CSNEG, CONV, COMP, FCSSEL, FCOMP, FCOMPE.
• ADC, ADCS, SBC, SBCS.
• MRS NZCV, MRS DAIF, MRS SPSel, MRS CurrentEL.

These instructions behave in one of the following ways:
• They are UNDEFINED.
• They execute as a NOP.
• They execute as in Non-debug state:
  — For the conditional operations and those using the PSTATE.C flag as an input, these instructions use an UNKNOWN value for the condition flag.
  — For the MRS instruction, they return an UNKNOWN value.
Instructions that explicitly modify the PSTATE. \{N, Z, C, V, Q, GE\}

These instructions are:

- ADDS, SUBS, ADCS, SBCS, ANDS, BICS, COM, CCOMP.
- FCMP, FCMPE, FCOMP, FCMPPE.
- MSR NZCV (register).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They have the same behavior as in Non-debug state.

Note

This includes instructions defined as UNPREDICTABLE in Non-debug state. These instructions are UNPREDICTABLE in Debug state.

Executing T32 instructions in Debug state

The following sections describe the behavior of the T32 instructions in Debug state:

- T32 instructions that are changed in Debug state.
- T32 instructions that are unchanged in Debug state.
- T32 instructions that are UNPREDICTABLE in Debug state on page H2-4995.

T32 instructions that are changed in Debug state

The following T32 instructions are defined in Debug state, but are UNDEFINED in Non-debug state:

- DCPS

Note

DCPS can be UNDEFINED in certain conditions in Debug state. See DCPS on page H2-5003.

- MRC p15,3,<Rt>,c4,c5,0 (DSPSR)
- MCR p15,3,<Rt>,c4,c5,0 (DSPSR)
- MRC p15,3,<Rt>,c4,c5,1 (DLR)
- MCR p15,3,<Rt>,c4,c5,1 (DLR)

In addition, ERET is executed as DRPS in Debug state.

For more information see Debug state instructions, DCPS, DRPS, MRS, MSR on page H2-5003.

T32 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state. Any T32 instruction that uses the PC or APSR.\{N, Z, C, V\} as the source or destination register is not included in the list. Moreover, the list only includes the 32-bit T32 encodings.

Any instruction that is UNDEFINED in Non-debug state

The list of instructions:

- Excludes any instruction listed in T32 instructions that are changed in Debug state.
Inclusion of any instruction listed in T32 instructions that are UNPREDICTABLE in Debug state on page H2-4995 that is UNDEFINED because an enable or disable bit is not RES0 or RES1.

Instructions that move System or Special-purpose registers to or from a general-purpose register

The list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes APSR and CPSR access instructions.
- Excludes instructions for accessing banked registers for the current mode.

These instructions are:

- MRS <spec_reg>_mode, MSR <spec_reg>_mode.

  Note
  This does not apply to cases which are UNPREDICTABLE in Non-debug state in the current mode.

- MRC <system_reg>, MCR <system_reg>

  Note
  This includes all allocated CP15 and CP14 System registers, other than an MRC move to APSR_nzcv.

- MRS SPSR, MSR SPSR
- VMRS <vfp_system_reg>, VMSR <vfp_system_reg>

  Note
  This includes all allocated Advanced SIMD and floating-point system registers, other than an a VMRS move to APSR_nzcv.

Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a single-precision register).
- VMOV (between a general-purpose register and a doubleword floating-point register).

SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a scalar).

Barriers

These instructions are:

- ISB.
- DSB.
- DMB.

Memory access instructions at various access sizes

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
  - Immediate (8-bit or 12-bit) offset.
  - Immediate (8-bit) post-indexed.
  - Immediate (8-bit) pre-indexed.
  - Unprivileged (8-bit).
- Not literal.
One of the following types:

- (Single) register.
- Dual.
- Exclusive.
- Exclusive doubleword.
- Acquire/Release.
- Acquire/Release Exclusive.
- Acquire/Release Exclusive doubleword.

These instructions are:

- LDRT, LDRBT, LDRHT, LDRSBT, LDRSHT (immediate).
- LDREX, LDREXB, LDREXH, LDA, LDAB, LDAH, LDAEX, LDAEXB, LDAEXH.
- LDREXD, LDAEXD.
- STR.W, STRB.W, STRH.W, STRD (immediate).
- STRT, STRBT, STRHT (immediate).
- STREX, STREXB, STREXH, STL, STLB, STLH, STLEX, STLEXB, STLEXH.
- STREXD, STLEXD.

Move to general-purpose register

These instructions are:

- MOV.W, MOVT (immediate).

Cache maintenance, Send Event, NOP, and Clear Exclusive

These instructions are:

- ICIALLU, ICIALLUIS, ICIMVAU (CP15 operations).
- DCCIMVAC, DCCISW, DCONVAC, DCONVAU, DCCSW, DCIMVAC, DCISW (CP15 operations).
- TLBIALL, TLBIALLH, TLBIALLHS, TLBIALLNSNH, TLBIALLNSNHIS, TLBIASID, TLBIASIDIS, TLBIIPAS2, TLBIIPAS2IS, TLBIIPAS2L, TLBIIPAS2LIS, TLBIMVA, TLBIMMVA, TLBIMVAAL, TLBIMVAALIS, TLBIMVAH, TLBIMVAHIS, TLBIMVAIS, TLBIMVAL, TLBIMVALH, TLBIMVALHIS, TALBIMVALIS (CP15 operations).
- ATS12NSOPR, ATS12NSOPW, ATS12NSOUR, ATS12NSOW, ATS12CP, ATS12CPW, ATS12CUR, ATS12CURW, ATS12HR, ATS12HW (CP15 operations).
- BPIALL, BPIALLIS, BPMVA (CP15 operations).
- SEV.W, SEVL.W.
- NOP.W (no operation hint).
- CLREX.

T32 instructions that are UNPREDICTABLE in Debug state

This subsection describes all instruction not listed in either:

- T32 instructions that are changed in Debug state on page H2-4993.
- T32 instructions that are unchanged in Debug state on page H2-4993.

These instructions are CONSTRAINED UNPREDICTABLE in Debug state. In general, the permissible behaviors are:

- The instruction generates an Undefined Instruction exception.
- The instruction executes as a NOP.
- If the instruction reads the PC or PSTATE, it uses an UNKNOWN value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets DLR and DSPSR to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for T32 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed.

**Exception-generating instructions**

These instructions are:
- SVC
- HVC
- SMC
- UDF
- BKPT
- HLT

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.
- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception the instruction would generate in Non-debug state. The exception is taken as described in *Exceptions in Debug state on page H2-5007*.

**Note**

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSR.SDD is set to 1.

**Instructions that explicitly write to the PC (branches)**

These instructions are:
- B, B (conditional), CBZ, CBNZ BL.
- BX, BLX (register or immediate).
- BXJ, TBB, TBH.
- MOV pc and related instructions.
- LDR pc, LDM (with a register list includes the PC), POP (with a register list that includes the PC).

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set DSPSR and DLR to UNKNOWN values.

**Exception return and related instructions**

These instructions are:
- SRS, RFE, SUBS pc, 1r, and related instructions.

**Note**

The T32 ERET instruction is decoded as DRPS and is not included in this list.

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
H2 Debug State
H2.4 Behavior in Debug state

They execute as in Non-debug state without branching, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values, and either:

- Execute as DRPS instead of performing an exception return, using UNKNOWN SPSR values.
- Not changing Exception level or PE mode.

**Note**
The T32 ERET instruction is decoded as DRPS and is not included in this list.

### Instructions that explicitly modify PSTATE, other than DCPS and DRPS

These instructions are:
- CPS, SETEND, IT.
- MSR CPSR (register or immediate).

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

### Instructions that suspend execution

These instructions are:
- WFE, WFI.

These instructions behave in one of the following ways:
- Are UNDEFINED.
- Execute as a NOP.
- Generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See *Configurable instruction enables and disables, and trap controls* on page G1-3919.

**Note**
This means that these instructions must not suspend execution.

### Instructions that read the PC

These instructions are:
- LDR (literal), LDRB (literal), LDRH (literal), LDRSB (literal), LDRSH (literal).
- ADR, ADRL, ADRH.
- PLD (literal), PLI (literal).

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state using an UNKNOWN value for the PC operand.

### Instructions that read PSTATE.{N, Z, C, V} or other PSTATE fields

These instructions are:
- SEL, VSEL.
- ADC, SBC, all instructions with an RRX shift.
- MRS CPSR.

These instructions behave in one of the following ways:
- They are UNDEFINED.
- They execute as a NOP.
• They execute as in Non-debug state:
  — For the conditional operations and those using the PSTATE.C flag as an input, these instructions use an UNKNOWN value for the condition flag.
  — For the MSR instruction, they return an UNKNOWN value

Instructions that explicitly modify \textit{PSTATE.\{N, Z, C, V, Q, GE\}}

These instructions are:
• CMP, TST, TEQ, TNM.
• <opc>S.
• MRC p14,0,APSR_nzcv,c0,c1,0 (DBGDSCRint).
• MSR CPSR, MSR APSR, (register or immediate).
• VMRS APSR_nzcv,FPSCR.
• QADD, QDADD, QSUB, QSUB.
• SMLBB. SMLATB, SMLATT, SMLAD, SMLWtb, SMLWt, SMLSD, SMUAD.
• SSAT, SSAT16, USAT, USAT16.
• SADD, SADD8, SADD16, SASX, SASS, SSUB, SSUB8, SSUB16.
• UADD, UADD8, UADD16, USA, USAX, USAUB, USU8, USUB8, USUB16.

These instructions behave in one of the following ways:
• They are UNDEFINED.
• They execute as a NOP.
• They execute as in Non-debug state, setting \textit{DSPSR\_EL0} and \textit{DLR\_EL0} to UNKNOWN values.

All other instructions

These instructions behave in one of the following ways:
• They are UNDEFINED.
• They execute as a NOP.
• They have the same behavior as in Non-debug state.

\begin{center}
\textbf{Note}
\end{center}

This includes instructions defined as UNPREDICTABLE in Non-debug state. These instructions are UNPREDICTABLE in Debug state. This includes some T32 instructions that specify R15 as a destination or source register, such as:

\begin{verbatim}
  MOV.W R15, #<uimm16>
  LDREX R15, [Rn]
\end{verbatim}

\textit{Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors} describes the CONSTRAINED UNPREDICTABLE behavior for these instructions. In Debug state these CONSTRAINED UNPREDICTABLE choices are further restricted:

• Instructions that specify R15 as a destination register:
  — Are not permitted to branch, because the architecture does not define a branch operation in Debug state.
  — Might set DLR and DSPSR to UNKNOWN values.
  — Might have any of the other permitted behaviors.

• Instructions that specify R15 as a source operand:
  — Cannot use PC + offset, because there is no architecturally-defined PC in Debug state.
  — Might have any of the other permitted behaviors, including using an UNKNOWN value.
H2.4.3 Decode tables

The syntax in the tables is defined as follows:

1 The bit has a fixed value of 1.
0 The bit has a fixed value of 0.
!= The field has any value other than the value or values specified. The field might be an encoding field in the instruction whose value is supplied by the debugger.

Note

The instruction encodings in Chapter C6 A64 Base Instruction Descriptions and Chapter F7 T32 and A32 Base Instruction Set Instruction Descriptions might show these bits as (0) or (1). A debugger must set these bits to 0 or 1, as appropriate.

Any other value indicates an encoding field in the instruction whose value is supplied by the debugger. Some values might be reserved or UNDEFINED, in which case the instruction is UNDEFINED or UNPREDICTABLE in Debug state, as it is in Non-debug state.

For more information about the instruction encodings, see:

• Chapter C6 A64 Base Instruction Descriptions.
• Chapter F7 T32 and A32 Base Instruction Set Instruction Descriptions.

For information about the syntax used in Table H2-2, Table H2-3, Table H2-4 on page H2-5000, and Table H2-5 on page H2-5001, see:

• Common syntax terms on page C1-121.
• Assembler symbols on page F2-2513.

Table H2-2 shows the A64 instructions that are modified in Debug state. For details of how these are packed in EDITR, see EDITR, External Debug Instruction Transfer Register on page H9-5168.

Table H2-2 Modified A64 instructions in Debug state

**H2.4.4 Security in Debug state**

If EL3 is implemented or the implemented Security state is Secure state, security in Debug state is governed by the Secure disable flag, **EDSCR.SDD**.

**On entry to Debug state**

If entering in Secure state, **EDSCR.SDD** is set to 0. Otherwise **EDSCR.SDD** is set to the inverse of `ExternalSecureInvasiveDebugEnabled()`. That is:

- If `ExternalSecureInvasiveDebugEnabled()` == TRUE, **EDSCR.SDD** is set to 0.
- If `ExternalSecureInvasiveDebugEnabled()` == FALSE, **EDSCR.SDD** is set to 1.

**Note**

Normally, if `ExternalSecureInvasiveDebugEnabled()` == FALSE then halting is prohibited and it is not possible to enter Debug state from Secure state. However, because changes to the authentication signals require a Context synchronization operation to guarantee their effect, there is a period during which the PE might halt even though the authentication signals prohibit halting.
In Debug state

The value of EDSCR.SDD does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

Note

- DBGAUTHSTATUS_EL1.{SNID, SID, NSNID, NSID} are not frozen in Debug state.
- If EDSCR.SDD set to 1 in Debug state, then there is no means to enter Secure state from Non-secure state. In this case it is impossible for the PE to be in Secure state. This is a general principle of behavior in Debug state.

In Non-debug state

EDSCR.SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a Context synchronization operation is required to guarantee their effect.

Note

- In Non-debug state, EDSCR.SDD is unaffected by the Security state of the PE.
- A Context synchronization operation is also required to guarantee that changes in the authentication signals are visible in DBGAUTHSTATUS_EL1.{SNID, SID, NSNID, NSID}.

If EL3 is not implemented and the implemented Security state is Non-Secure state, EDSCR.SDD is RES1.

H2.4.5 Privilege in Debug state

The only additional privileges offered to Debug state are:

- The privilege to execute Debug state instructions, DCPS, DRPS, MRS, MSR on page H2-5003.
- The privilege to execute DTR access instructions regardless of the Exception level and traps.

In Non-debug state, the Debug state instructions are UNDEFINED, except for the T32 DRPS instruction. The T32 DRPS instruction uses the encoding of the Non-debug T32 ERET instruction.

In Debug state, the Debug state instructions can be executed at any Exception level. However, there are some cases where the instructions are UNDEFINED. For more information, see Debug state instructions, DCPS, DRPS, MRS, MSR on page H2-5003. These instructions generate an Undefined Instruction exception when they are UNDEFINED.

If this Undefined Instruction exception is taken to an Exception level using AArch64, it is reported using ESR_ELx.EC, with the code 0x00, and if taken to AArch32 Hyp mode, reported using HSR.EC of 0x00.

The DTR access instructions can be executed at any Exception level, including EL0, regardless of any control register settings that might force these instructions to be UNDEFINED or trapped in Non-debug state. These instruction are:

- The MRS and MSR instructions that access DBGDTRX_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0 in AArch64 state.
- The MRC and MCR instructions that access DBGDTRXint and DBGDTRRXint in AArch32 state.

All other instructions operate with the privilege determined by the current Exception level and security state. This applies to all Special-purpose and System registers accesses, memory accesses, and UNDEFINED instructions, and includes generating exceptions when the system registers trap or disable an instruction.
ARMv8 defines instructions to change between Exception levels in Debug state. These instructions can also change the mode at the current Exception level.

**DCPS**

DCPS allows the debugger to move the PE to a higher Exception level or to a specific mode at the current Exception level.

If the DCPS instruction is executed in AArch32 state and the target Exception level is using AArch64:

- The current instruction set switches from T32 to A64.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for system calls in Non-debug state. See [Execution state on page D1-1493](#).

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE can change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- In AArch64, the current endianness is set according to SCTLR_ELx.EE for the target Exception level.
- In AArch32, the current endianness is set according to SCTLR.EE or HSCTLR.EE for the target Exception level.

The assembler syntax for the DCPS instructions is:

```
DCPS1  {#<uimm16>}
DCPS2  {#<uimm16>}
DCPS3  {#<uimm16>}
```

<uimm16> is only available in the A64 encoding and is ignored by hardware.

The decode can be found in the instruction descriptions for DCPS1, DCPS2, and DCPS3 for A64, and DCPS1, DCPS2, DCPS3 for T32.

DCPS is UNDEFINED in Non-debug state.

Table H2-6 on page H2-5004 shows the target of the instruction. In Table H2-6 on page H2-5004 the entries have the following meaning:

**EL1h/Svc**

This means that the target is:

- EL1h if EL1 is using AArch64.
- EL1 and Supervisor mode if EL1 is using AArch32.

**EL2h/Hyp**

This means that the target is:

- EL2h if EL2 is using AArch64.
- EL2 and Hyp mode if EL2 is using AArch32.

**EL3h/Monitor**

This means that the target is:

- EL3h if EL3 is using AArch64.
• EL3 and Monitor mode if EL3 is using AArch32.

### Table H2-6 Target for DCPS instructions in Debug state

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Target when taken from Exception level:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EL0</td>
</tr>
<tr>
<td>DCPS1</td>
<td>EL1h/Svc</td>
</tr>
<tr>
<td>DCPS2</td>
<td>EL2h/Hyp</td>
</tr>
<tr>
<td>DCPS3</td>
<td>EL3h/Monitor</td>
</tr>
</tbody>
</table>

#### Note

- In AArch32 Monitor mode, DCPS1 and DCPS3 clear SCR.NS to 0.
- In AArch64, at EL3, DCPS does not change SCR_EL3.NS.

However:

- **DCPS1** is **UNDEFINED** at EL0 in Non-secure state if both:
  - EL2 is implemented.
  - HCR_EL2.TGE == 1.
- **DCPS2** is **UNDEFINED** at all Exception levels if EL2 is not implemented.
- **DCPS2** is **UNDEFINED** at the following Exception levels if EL2 is implemented:
  - At EL0 and EL1 in Secure state.
  - At EL3 if EL3 is using AArch32.
- **DCPS3** is **UNDEFINED** at all Exception levels if either:
  - EDSCR.SDD == 1.
  - EL3 is not implemented.

DCPS is also defined in T32, see DCPS1, DCPS2, DCPS3 on page F7-2728. There is no A32 encoding.

On executing a DCPS instruction:

- If the target Exception level is using AArch64:
  - ELR_ELx of the target Exception level becomes **UNKNOWN**.
  - SPSR_ELx of the target Exception level becomes **UNKNOWN**.
  - ESR_ELx of the target Exception level becomes **UNKNOWN**.
  - DLR_EL0 and DSPSR_EL0 become **UNKNOWN**.

- If the target Exception level is using AArch32 DLR and DSPSR become **UNKNOWN** and:
  - If the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become **UNKNOWN**.
  - If the target Exception level is EL2, then ELR_hyp, SPSR_hyp, and HSR become **UNKNOWN**.

If the target Exception level is using AArch32, and the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become **UNKNOWN**.

The pseudocode for DCPSInstruction() is as follows:

```c
// DCPSInstruction()
// ================
// Operation of the DCPS instruction in Debug state
DCPSInstruction(bits(2) target_el)
    SynchronizeContext();
```
case target_el of
  when EL1
    if PSTATE.EL == EL2 || (PSTATE.EL == EL3 && !UsingAArch32()) then handle_el = PSTATE.EL;
    elsif HaveEL(EL2) && !IsSecure() && HCR_EL2.TGE == '1' then UndefinedFault();
    else handle_el = EL1;
  when EL2
    if !HaveEL(EL2) then UndefinedFault();
    elsif PSTATE.EL == EL3 && !UsingAArch32() then handle_el = EL3;
    elsif IsSecure() then UndefinedFault();
    else handle_el = EL2;
  when EL3
    if EDSCR.SDD == '1' || !HaveEL(EL3) then UndefinedFault();
    handle_el = EL3;
  if ELUsingAArch32(handle_el) then
    if PSTATE.M == M32_Monitor then SCR.NS = '0';
    assert UsingAArch32(); // Cannot move from AArch64 to AArch32
    case handle_el of
      when EL1  AArch32.WriteMode(M32_Svc);
      when EL2  AArch32.WriteMode(M32_Hyp);
      when EL3  AArch32.WriteMode(M32_Monitor);
    if handle_el == EL2 then
      ELR_hyp = bits(32) UNKNOWN;  HSR = bits(32) UNKNOWN;
      else
      LR = bits(32) UNKNOWN;
      SPSR[] = bits(32) UNKNOWN;
      PSTATE.E = SCTLR[]_.EE;
      else // Targeting AArch64
        if UsingAArch32() then AArch64.MaybeZeroRegisterUppers();
        ELR[] = bits(64) UNKNOWN;  SPSR[] = bits(32) UNKNOWN;  ESR[] = bits(32) UNKNOWN;
        PSTATE.nRW = '0';  PSTATE.SP = '1';  PSTATE.EL = handle_el;
        DLR_EL0 = bits(64) UNKNOWN;  DSPSR_EL0 = bits(32) UNKNOWN;
        UpdateEDSCRFields(); // Update EDSCR processor state flags.
      return;

DRPS

DRPS allows the debugger to move the PE to a lower Exception level or to another mode at the current Exception level by copying the current SPSR to PSTATE.

If DRPS is executed in AArch64 state and the target Exception level is using AArch32:

- The current instruction set switches from A64 to T32.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for exception returns in Non-debug state. See Execution state on page D1-1493.

Otherwise the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE can change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- If targeting an Exception level using AArch64, current endianness is set according to SCTLR_ELx.EE, or SCTLR_EL1.E0E for the target Exception level.
- If targeting an Exception level using AArch32, current endianness is set by SPSR.E as appropriate.

The assembler syntax for the DRPS instruction is:

```
DRPS
```

The decode can be found in the instruction description for DRPS.
If the SPSR specifies an illegal exception return, then \texttt{PSTATE.\{M, nRW, EL, SP\}} are unchanged and \texttt{PSTATE.IL} is set to 1. For further information on illegal exception returns, see \textit{Illegal return events from AArch64 state on page D1-1534}.

\texttt{PSTATE.\{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F\}} are ignored in Debug state. This means that the effect of \texttt{DRPS} on these fields is to set them to an \texttt{UNKNOWN} value that might be the value from the SPSR. For more information see \textit{Process state (PSTATE) in Debug state on page H2-4988}.

All other \texttt{PSTATE} fields are copied from SPSR.

\texttt{DRPS} is \texttt{UNDEFINED} at EL0 and in Non-debug state. In Debug state, the T32 encoding for \texttt{EREIT} is decoded as \texttt{DRPS}. There is no A32 encoding for \texttt{DRPS}.

\textbf{Note}  

Unlike an exception return, \texttt{DRPS} has no architecturally-defined effect on the Event Register and exclusive monitors. \texttt{DRPS} might set the Event Register or clear the exclusive monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

On executing a \texttt{DRPS} instruction:

- If the target Exception level is using AArch64:
  - \texttt{DLR\_EL0} and \texttt{DSPSR\_EL0} become \texttt{UNKNOWN}.
- If the target Exception level is using AArch32:
  - \texttt{DLR} and \texttt{DSPSR} become \texttt{UNKNOWN}.

The pseudocode for \texttt{DRPS\texttt{Instruction}()} is as follows:

\begin{verbatim}
// DRPS\texttt{Instruction}()
// =============
// Operation of the A64 DRPS and T32 ERET instructions in Debug state
DRPS\texttt{Instruction}()
    SynchronizeContext();
    \texttt{SetPSTATFromPSR(SPSR[]);};
    \texttt{// PSTATE.\{N,Z,C,V,Q,GE,SS,D,A,I,F\} are not observable and ignored in Debug state, so}
    \texttt{// behave as if UNKNOWN.}
    if UsingAArch32() then
        PSTATE.<N,Z,C,V,Q,GE,SS,A,I,F> = bits(13) UNKNOWN;
        \texttt{// In AArch32, all instructions are T32 and unconditional.}
        PSTATE.IT = '00000000'; PSTATE.T = '1'; \texttt{// PSTATE.J is RES0}
    else
        PSTATE.<N,Z,C,V,SS,D,A,I,F> = bits(9) UNKNOWN;
        DLR\_EL0 = bits(64) UNKNOWN; DSPSR\_EL0 = bits(32) UNKNOWN;
        UpdateEDSCRFields(); \texttt{// Update EDSCR processor state flags.}
    return;
\end{verbatim}

\textbf{MRS and MSR instructions to access DLR\_EL0 and DSPSR\_EL0}

The other Debug state instructions are \texttt{MRS} and \texttt{MSR} (register) instructions to read or write \texttt{DLR\_EL0} and \texttt{DSPSR\_EL0}, and the equivalent \texttt{MRC} and \texttt{MCR} operations in AArch32 state.

\begin{verbatim}
MRS <Xt>, DLR\_EL0 ; Copy DLR\_EL0 to <Xt>
MRS <Xt>, DSPSR\_EL0 ; Copy DSPSR\_EL0 to <Xt>
MSR DLR\_EL0, <Xt> ; Copy <Xt> to DLR\_EL0
MSR DSPSR\_EL0, <Xt> ; Copy <Xt> to DSPSR\_EL0
\end{verbatim}

These instructions can be executed at any Exception level when in Debug state, including EL0. They are \texttt{UNDEFINED} in Non-debug state.
H2.4.7 Exceptions in Debug state

The following sections describe how exceptions are handled in Debug state:

• Generating exceptions when in Debug state.
• Taking exceptions when in Debug state.
• Reset in Debug state on page H2-5010.

Generating exceptions when in Debug state

In Debug state:

• Instruction Abort exceptions cannot happen because instructions are not fetched from memory.
• Interrupts, including SError and virtual interrupts are ignored and remain pending:
  — The pending interrupt remains visible in ISR.
• Debug exceptions are ignored.
• SCR.EA is treated as if it were set to 0, regardless of its actual state, other than for the purpose of reading the bit.
• All instruction bit patterns that are an allocated instruction at the current Exception level, but listed in Executing instructions in Debug state on page H2-4988 as UNDEFINED in Debug state, generate Undefined Instruction exceptions, which are taken to the current Exception level, or to EL1 if executing at EL0. This includes SVC, HVC, SMC, BRK, and HLT. The priority and syndrome for these exceptions is the same as for executing an encoding that does not have an allocated instruction.
• Instructions executed at EL2, EL1 and EL0 that are configured by EL3 control registers to trap to EL3:
  — Generate the appropriate trap exception taken to EL3 if EDSCR.SDD == 0.
  — Generate an Undefined Instruction exception taken to the current Exception level, or to EL1 if executing at EL0, if EDSCR.SDD == 1. If the exception is taken to an Exception level using AArch64 or to AArch32 Hyp mode, this is reported with an exception class of 0x00. Otherwise configurable traps, enables, and disables, for instructions are unaffected by Debug state, and executing the affected instructions generates the appropriate exceptions.

Otherwise, synchronous exceptions, including Data Aborts, are generated as they would be in Non-debug state and taken to the appropriate Exception level in Debug state.

——— Note ————

If EDSCR.SDD == 1 then an exception from Non-secure state is never taken to Secure state. See Security in Debug state on page H2-5001.

Taking exceptions when in Debug state

When the PE is in Debug state, all exceptions are synchronous. When an exception is generated, it is taken to Debug state. This means that:

• The target Exception level is as defined for the exception in Non-debug state.

• If the target Exception level is using AArch32 then the target PE mode is as defined for the exception in Non-debug state.

• The exception is reported as defined for the exception in Non-debug state, using the syndrome register or registers for the target Exception level. In AArch64, these are ESR_ELx, and FAR_ELx. In AArch32, these are DFSR, DFAR, HSR, HDFAR, and HPFAR. For example:
  — If a Data Abort exception is taken to Abort mode at EL1 or EL3 and the exception is taken from AArch32 state and using the Short-descriptor translation table format, the DFSR reports the exception using the Short-descriptor format fault encoding. For exceptions other than Data Abort exceptions taken to Abort mode, DFSR is not updated.
— If an instruction is trapped to an Exception level using AArch64 due to a configurable trap, disable, or enable, the exception code reported is the same as it would be in Non-debug state.

The effect on auxiliary syndrome registers, such as AFSR, is IMPLEMENTATION DEFINED.

- The PE remains in Debug state and changes to the target mode.
- If EL3 is using AArch32 and the exception is taken from Monitor mode, SCR.NS is cleared to 0.
- If the exception is taken to an Exception level using AArch32, the PE continues to execute T32 instructions, regardless of the TE bit in the system control register for the target Exception level.
- The endianness switches to that indicated by the EE bit of the system control register for the target Exception level.
- The SPSR for the target Exception level or mode is corrupted and becomes UNKNOWN.
- If the target Exception level is using AArch64, ELR_ELx for the target Exception level becomes UNKNOWN.
- If the target Exception level is EL2 using AArch32, ELR_hyp becomes UNKNOWN.
- If the target Exception level is EL1 or EL3 using AArch32, LR_<mode> for the target mode becomes UNKNOWN.
- DLR and DSPSR become UNKNOWN.
- The cumulative error flag, EDSCR.ERR, is set to 1. See Cumulative error flag on page H4-5051.
- PSTATE.IL is cleared to 0.
- PSTATE.<TT, SS, D, A, I, F> are set to UNKNOWN values, and PSTATE.<NZCVQGE> are unchanged. However, these fields are ignored and are not observable in Debug state. For more information see Process state (PSTATE) in Debug state on page H2-4988.

The debugger must save any state that can be corrupted by an exception before executing an instruction that might generate another exception.

**Pseudocode description of taking exceptions in Debug state**

The pseudocode function TakeException() in Pseudocode description of exception entry to AArch64 state on page D1-1518 shows the behavior when the PE takes an exception to an Exception level using AArch64 in Non-debug state. In Debug state, this is replaced with the function TakeExceptionInDebugState().

```cpp
// AArch64.TakeExceptionInDebugState
// ===================================
// Take an exception in Debug state to an Exception Level using AArch64.
AArch64.TakeExceptionInDebugState(bits(2) target_el, ExceptionRecord exception)
assert HaveEL(target_el) && !ELUsingAArch32(target_el) && UInt(target_el) >= UInt(PSTATE.EL);
// If coming from AArch32 state, the top parts of the X[] registers might be set to zero
from_32 = UsingAArch32();
if from_32 then AArch64.MaybeZeroRegisterUppers();
AArch64.ReportException(exception, target_el);
PSTATE_EL = target_el;  PSTATE.nRW = '0';  PSTATE.SP = '1';
SPSR[] = bits(32) UNKNOWN;
ELR[] = bits(64) UNKNOWN;
// PSTATE.<SS,D,A,I,F> are not observable and ignored in Debug state, so behave as if UNKNOWN.
PSTATE.<SS,D,A,I,F> = bits(5) UNKNOWN;
DLR_EL0 = bits(64) UNKNOWN;
DSPSR_EL0 = bits(32) UNKNOWN;
PSTATE.IL = '0';
if from_32 then // Coming from AArch32
```

H2 Debug State

H2.4 Behavior in Debug state

PSTATE.IT = '00000000'; PSTATE.T = '0'; // PSTATE.J is RES0

EDSCR.ERR = '1';
UpdateEDSCRFields(); // Update EDSCR processor state flags.
EndOfInstruction();

The pseudocode functions EnterMode(), EnterHypMode(), and EnterMonitorMode() in Additional pseudocode functions for exception handling on page G1-3900 show the behavior when the PE takes an exception to an Exception level using AArch32 in Non-debug state. In Debug state, EnterMode() is replaced with the function EnterModeInDebugState().

// AArch32.EnterModeInDebugState()
// ----------------------------------------
// Take an exception in Debug state to a mode other than Monitor and Hyp mode.

AArch32.EnterModeInDebugState(bits(5) target_mode)
assert ELUsingAArch32(EL1) && PSTATE.EL != EL2;

if PSTATE.M == M32_Monitor then SCR.NS = '0';
AArch32.WriteMode(target_mode);
SPSR[] = bits(32) UNKNOWN;
R[14] = bits(32) UNKNOWN;
// In Debug state, the PE always execute T32 instructions when in AArch32 state, and
// PSTATE.(SS,A,I,F) are not observable so behave as UNKNOWN.
PSTATE.T = '1'; // PSTATE.J is RES0
PSTATE.<SS,A,I,F> = bits(4) UNKNOWN;
DLR = bits(32) UNKNOWN;
DSPSR = bits(32) UNKNOWN;
PSTATE.E = SCTLR.EE;
PSTATE.IL = '0';
PSTATE.IT = '00000000';
EDSCR.ERR = '1';
UpdateEDSCRFields(); // Update EDSCR processor state flags.
EndOfInstruction();

In Debug state, EnterHypMode() is replaced with the function EnterHypModeInDebugState().

// AArch32.EnterHypModeInDebugState()
// ----------------------------------------
// Take an exception in Debug state to Hyp mode.

AArch32.EnterHypModeInDebugState(ExceptionRecord exception)
assert HaveEL(EL2) && !IsSecure() && ELUsingAArch32(EL2);

AArch32.WriteMode(M32_Hyp);
AArch32.ReportHypEntry(exception);
SPSR[] = bits(32) UNKNOWN;
ELR_hyp = bits(32) UNKNOWN;
// In Debug state, the PE always execute T32 instructions when in AArch32 state, and
// PSTATE.(SS,A,I,F) are not observable so behave as UNKNOWN.
PSTATE.T = '1'; // PSTATE.J is RES0
PSTATE.<SS,A,I,F> = bits(4) UNKNOWN;
DLR = bits(32) UNKNOWN;
DSPSR = bits(32) UNKNOWN;
PSTATE.E = HSCTLR.EE;
PSTATE.IL = '0';
PSTATE.IT = '00000000';
EDSCR.ERR = '1';
UpdateEDSCRFields();
EndOfInstruction();

In Debug state, EnterMonitorMode() is replaced with EnterMonitorModeInDebugState().

// AArch32.EnterMonitorModeInDebugState()
// ----------------------------------------
// Take an exception in Debug state to Monitor mode.

AArch32.EnterMonitorModeInDebugState()
assert HaveEL(EL3) & ELUsingAArch32(EL3);

if PSTATE.M == M32_Monitor then SCR.NS = '0';
AArch32.WriteMode(M32_Monitor);
SPSR[] = bits(32) UNKNOWN;
R[14] = bits(32) UNKNOWN;
// In Debug state, the PE always execute T32 instructions when in AArch32 state, and
// PSTATE.{SS,A,I,F} are not observable so behave as UNKNOWN.
PSTATE.T = '1';                             // PSTATE.J is RES0
PSTATE.<SS,A,I,F> = bits(4) UNKNOWN;
DLR = bits(32) UNKNOWN;
DSPSR = bits(32) UNKNOWN;
PSTATE.E = SCTLR.EE;
PSTATE.IR = '0';
PSTATE.IF = '00000000';
EDSCR.ERR = '1';
UpdateEDSCRFields();                        // Update EDSCR processor state flags.
EndOfInstruction();

Reset in Debug state

If the PE is reset when in Debug state, it exits Debug state and enters Non-debug reset state. When the PE is in reset state, EDSR.STATUS == 0b000010 and writes to EDITR are ignored.

Note

If EDCR.RCE == 1, meaning that a Reset Catch debug event is programmed, and if halting is allowed on exiting reset state, then on exiting reset state the PE halts and re-enters Debug state. See Reset Catch debug event on page H3-5036. All PE registers have taken their reset values, which might be UNKNOWN.

H2.4.8 Accessing registers in Debug state

Register accesses are unchanged in Debug state. The view of each register is determined by either the current Exception level or the mode, or both, and accesses might be disabled or trapped by controls at a higher Exception level.

General-purpose register access, other than SP access in AArch64 state

A single general-purpose register can be read by issuing an MSR instruction through the ITR to write DBGDTR_EL0 in AArch64 state, or an MCR instruction through the ITR to write DBGDTRXTint in AArch32 state. The debugger can then read the DTR register or registers through the external debug interface. The reverse sequence writes to a general-purpose register.

Figure H2-1 on page H2-5011 shows the reading and writing of general-purpose registers, other than SP, in Debug state in AArch64 state.
Figure H2-1 Reading and writing general-purpose registers, other than SP, in Debug state in AArch64 state
Figure H2-2 shows the reading and writing of general-purpose registers in Debug state in AArch32 state.

![Diagram of register access](image)

**SIMD and floating-point, and system register accesses, and SP access in AArch64 state**

To read a SIMD and floating-point register or a system register, the debugger must first copy the value into a general-purpose register using:

- An `FMOV` instruction in AArch64 or a `VMOV` instruction in AArch32 for floating-point transfers to SIMD and FP registers.
- A `UMOV` instruction in AArch64 or a `VMOV` instruction in AArch32 for SIMD transfers to SIMD and FP registers.
- An `MRS` instruction in AArch64 or an `MRC` instruction in AArch32 for system registers.
- A `MOV Xd, SP` instruction for the SP register in AArch64 state.

The debugger can then read out the particular general-purpose register. The reverse sequence writes a register.

**PC and PSTATE access**

The debugger reads the program counter and PSTATE of the process being debugged through the DLR_EL0 and DSPSR_EL0 system registers. The actual values of PC and PSTATE cannot be directly observed in Debug state:

- Instructions that are used for direct reads and writes of PC and PSTATE in Non-debug state are **UNDEFINED** in Debug state.
- On taking an exception, ELR_ELx and SPSR_ELx at the target exception level are **UNKNOWN**. They do not record the PC and PSTATE.

PSTATE. {IL, E, M, nRW, EL, SP} are indirectly read by instructions executed in Debug state, but all other PSTATE fields are ignored and cannot be observed. See also:

- **Process state (PSTATE) in Debug state on page H2-4988.**
- **Executing instructions in Debug state on page H2-4988.**
- **Exceptions in Debug state on page H2-5007.**
H2.4.9 Accessing memory in Debug state

How the PE accesses memory is unchanged in Debug state. This includes:

- The operation of the MMU, including address translation, tagged address handling, access permissions, memory attribute determination, and the operation of any TLBs.
- The operation of any caches and coherency mechanisms.
- Alignment support.
- Endianness support.
- The Memory order model.

Simple memory transfers

Simple memory accesses can be performed in Debug state by issuing memory access instructions through the ITR and passing data through the DTR registers. Executing instructions in Debug state on page H2-4988 lists the memory access instructions that are supported in Debug state.

Bulk memory transfers

Memory access mode can accelerate bulk memory transfers in Debug state. See DCC and ITR access modes on page H4-5045.
H2.5 Exiting Debug state

The PE exits Debug state when it receives a Restart request trigger event. If EDSCR.ITE == 0 the behavior of any instruction issued through the ITR in Normal access mode or an operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state after the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

--- Note ---

- Implementations can set EDSCR.ITE to 1 to indicate that further instructions can be accepted by ITR before the previous instructions have completed. If any previous instruction has not completed and EDSCR.ITE == 1, then the PE must complete these instructions in Debug state before executing the restart sequence. EDSCR.ITE == 0 indicates that the PE is not ready to restart.

- A debugger must observe that any instructions issued through EDITR that might generate a synchronous exception, as complete, before issuing a restart request. It can do this by observing the completion of a later instruction, as synchronous exceptions must occur in program order. For example, a debugger can observe that an instruction that reads or writes a DTR register is complete because of its effect on the EDSCR.{{TXfull, RXfull}} flags.

On exiting Debug state, the PE sets the program counter to the address in DLR, where:

- If exiting to AArch32 state:
  - Bits[63:32] of DLR are ignored.
  - Bits[31:1] of the PC are set to the value of bits[31:1] of DLR.
  - Bit[0] of the PC is set to a CONSTRAINED UNPREDICTABLE choice of 0 or the value of bit[0] in DLR.

- If exiting to AArch64 state:
  - Bits[63:56] of DLR_EL0[31:0] might be ignored as part of tagged address handling. See Address tagging in AArch64 state on page D4-1726.
  - Otherwise the PC is set from DLR_EL0[31:0].

Exit from Debug state can give rise to a misaligned PC exception when the program counter is used. Unlike an exception return, this might also happen when returning to AArch32 state. For more information, see PC alignment checking on page D1-1509.

On exiting Debug state, PSTATE is set from DSPSR in the same way that an exception return sets PSTATE from SPSR_ELx:

- The same illegal exception return checks that apply to an exception return also apply to exiting Debug state. If the return from Debug state is an illegal exception return then the effect on PSTATE and the PC is the same as for any other illegal exception return. See Exception return on page D1-1533 and Exception return to an Exception level using AArch32 on page G1-3860.

- The checks on the PSTATE.IT bits that apply to exiting Debug state into AArch32 state are the same as those that apply to an exception return. See Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors.
• PSTATE.SS is copied from DSPSR.SS if all of the following hold:
  — MDSCR_EL1.SS == 1.
  — The debug target Exception level is using AArch64.
  — Software step exceptions from the restart Exception level are enabled.
Otherwise PSTATE.SS is set to 0.

—— Note ———
Unlike a return using ERET, PSTATE.SS must be restored from DSPSR.SS because otherwise it is UNKNOWN.

However, if OSDLR.DLK == 1 and DBGPRCR.CORENPDRO == 0, meaning the OS Double Lock is
locked in Non-debug state and therefore Software Step exceptions are disabled, but otherwise Software Step
exceptions would be enabled from the restart Exception level, it is CONSTRAINED UNPREDICTABLE whether
PSTATE.SS is copied from DSPSR.SS.

—— Note ———
• One important difference between Debug state exit and an exception return is that the PE can exit Debug state
  at EL0. Despite this, the behavior of an exit from Debug state is similar to an exception return. For example,
PSTATE.{D, A, I, F} is updated regardless of the value of SCTLR_EL1.UMA.
• Exit from Debug state has no architecturally-defined effect on the Event Register and exclusive monitors. An
  exit from Debug state might set the Event Register or clear the exclusive monitors, or both, but this is not a
  requirement and debuggers must not rely on any implementation specific behavior.

The pseudocode for ExitDebugState() is as follows.

// ExitDebugState()
// ================
ExitDebugState()
assert Halted();
SynchronizeContext();

 // Although EDSCR.STATUS signals that the processor is restarting, debuggers must use EDPRSR.SDR
 // to detect that the processor has restarted.
EDSCR.STATUS = '000001';                           // Signal restarting
EDESR<2:0> = '000';                                // Clear any pending Halting debug events
new_pc = DLR_EL0;
spsr = DSPSR;

// If this is an illegal return, SetPSTATEFromPSR() will set PSTATE.IL.
SetPSTATEFromPSR(spsr);                            // Can update privileged bits, even at EL0.

if UsingAArch32() then
  if ConstrainUnpredictableBool() then new_pc<0> = '0';
  BranchTo(new_pc<31:0>, BranchType_UNKNOWN);    // AArch32 branch
else
  // If targeting AArch32 then possibly zero the 32 most significant bits of the target PC
  if spsr<4> == '1' & ConstrainUnpredictableBool() then
    new_pc<63:32> = Zeros();
  BranchTo(new_pc, BranchType_DBGEXIT);          // A type of branch that is never predicted

(EDSCR.STATUS,EDPRSR.SDR) = ('000010','1');        // Atomically signal restarted
UpdateEDSCRFields();                               // Stop signalling processor state.
DisableITRAndResumeInstructionPrefetch();
return;
Chapter H3
Halting Debug Events

This chapter describes a particular class of debug events. It contains the following sections:

- *Introduction to Halting debug events* on page H3-5018.
- *Halting Step debug event* on page H3-5020.
- *Halt Instruction debug event* on page H3-5030.
- *Exception Catch debug event* on page H3-5031.
- *External Debug Request debug event* on page H3-5034.
- *OS Unlock Catch debug event* on page H3-5035.
- *Reset Catch debug event* on page H3-5036.
- *Software Access debug event* on page H3-5037.
- *Synchronization and Halting debug events* on page H3-5038.

---

**Note**

Table J11-1 on page J11-5816 disambiguates the general register references used in this chapter.
H3.1 Introduction to Halting debug events

External debug defines Halting debug events. The following Halting debug events are available in ARMv8:

- Halting Step debug event on page H3-5020.
- Halt Instruction debug event on page H3-5030.
- Exception Catch debug event on page H3-5031.
- External Debug Request debug event on page H3-5034.
- OS Unlock Catch debug event on page H3-5035.
- Reset Catch debug event on page H3-5036.
- Software Access debug event on page H3-5037.

If halting is allowed, a Halting debug event halts the PE. The PE enters Debug state.

In addition, breakpoints and watchpoints might halt the PE if halting is allowed. See Breakpoint and Watchpoint debug events on page H2-4978. Because breakpoints and watchpoints can generate an exception or halt the PE, Breakpoint and Watchpoint debug events are not classified as Halting debug events.

For a definition of Debug state, see Chapter H2 Debug State. For a definition of halting allowed, see Halting allowed and halting prohibited on page H2-4977.

Debug state entry and debug event prioritization on page H2-4979 describes the behavior when multiple debug events are generated by an instruction.

See also Synchronization and Halting debug events on page H3-5038.

Table H3-1 shows the behavior of Breakpoint, Watchpoint, and Halting debug events.

H3.2 Halting Step debug event

Halting Step is a debug resource that a debugger can use to make the PE step through code one instruction at a time. This section describes the Halting Step debug events. It is divided into the following sections:

- Overview of a Halting Step debug event.
- The Halting Step state machine.
- Using Halting Step on page H3-5023.
- Detailed Halting Step state machine behavior on page H3-5023.
- Synchronization and the Halting Step state machine on page H3-5026.
- Stepping T32 IT instructions on page H3-5027.
- Disabling interrupts while stepping on page H3-5028.
- Syndrome information on Halting Step on page H3-5028.
- Pseudocode description of Halting Step debug events on page H3-5029.

The architecture describes the behavior as a simple Halting Step state machine. See The Halting Step state machine.

H3.2.1 Overview of a Halting Step debug event

The behavior of Halting Step is defined by a state machine, shown in Figure H3-1 on page H3-5022. A Halting Step debug event executes a single instruction and then returns control to the debugger. When the debugger software wants to execute a Halting Step:

1. With the PE in Debug state, the debugger activates Halting Step.
2. The debugger signals the PE to exit Debug state and return to the instruction that is to be stepped.
3. The PE executes that single instruction.
4. The PE enters Debug state before executing the next instruction.

However, an exception might be generated while the instruction is being stepped. That is either:
- A synchronous exception generated by the instruction being stepped.
- An asynchronous exception taken before or after the instruction being stepped.

Halting Step has its own enable control bit, EDECR.SS and EDESR.SS.

Note
Because the Halting Step state machine states occur as a result of normal PE operation, the states can be described as both:
- PE states.
- Halting Step states.

H3.2.2 The Halting Step state machine

The state machine states are:

**Inactive**

Halting Step is inactive. No Halting Step debug events can be generated, therefore execution is not affected by Halting Step. The PE is in this state whenever either of the following is true:
- Halting Step is disabled. That is, EDECR.SS is set to 0 and EDESR.SS is set to 0.
- Halting is prohibited. See Halting the PE on debug events on page H2-4977.

In Figure H3-1 on page H3-5022 this state is shown in red.

**Active-not-pending**

Halting Step is enabled and active. This is the state in which the PE steps an instruction. EDECR.SS == 1 and EDESR.SS == 0. A debugger must only set EDECR.SS to 1 when the PE is in Debug state.

In Figure H3-1 on page H3-5022 this state is shown in green.
Active-pending

Halting Step is enabled and active. The step has completed, and the PE enters Debug state. 
EDESR.SS == 1.

In Figure H3-1 on page H3-5022 this state is shown in green.

Whenever Halting Step is enabled and active, whether the state machine is in the active-not-pending state or in the active-pending state depends on EDESR.SS. Halting Step state machine states on page H3-5023 shows this.

In the simple sequential execution of the program the PE executes the Halting Step state machine, as follows:
1. Initially, Halting Step is inactive.
2. After exiting Debug state, Halting Step is active-not-pending.
3. The PE executes an instruction and Halting Step is active-pending.
4. The pending Debug state entry is taken on the next instruction and the step is complete.

Exceptions and other changes to the PE context can interrupt this sequence.

Figure H3-1 on page H3-5022 shows a Halting Step state machine.
**H3 Halting Debug Events**

**H3.2 Halting Step debug event**

---

**Halting step is disabled**

- Write 1 to EDECR.SS

**Halting step is enabled**

- EDES.R.SS is set to 0 by the exit from Debug state

**Execution within Secure state**

- Debug state exit with halting prohibited
- Return to Non-secure state

**Inactive**

- EDECR.SS=1
- EDES.R.SS=0
- Halting prohibited

**Active-not-pending**

- EDECR.SS=1
- EDES.R.SS=0
- Halting allowed

**Step completed**

- Exception other than SMC to Secure state where halting is prohibited
- Asynchronous exception

**Debug state exit**

- EDECR.SS=1
- EDES.R.SS=1
- Halting allowed

**Debug state entry**

- Return to Non-secure state

**Inactive**

- EDECR.SS=1
- EDES.R.SS=1
- Halting prohibited

**Active pending**

- EDECR.SS=1
- EDES.R.SS=1
- Halting allowed

**Step completed**

- A debug event, other than a Halting Step debug event, causes entry into Debug state.
- An instruction is executed without taking an exception.
- An exception is taken to a state where halting is allowed.
- A reset.
- An SMC exception is taken to Secure state where halting is prohibited.

---

**Figure H3-1 Halting Step state machine**
The following bits control the state machine, as shown in Table H3-3:

- **EDECR.SS.** This is the Halting Step enable bit.

  — The EDECR value is preserved over powerdown, meaning that the step active state is maintained over a powerdown event.
  — A debugger must only set EDECR.SS to 1 when the PE is in Debug state.

- **EDESR.SS.**

Table H3-3 shows the Halting Step state machine states. The letter X in a register column means that the relevant bit can be set to either zero or one.

<table>
<thead>

<td>Active-not-pending</td>
</tr>
<tr>
<td>Allowed</td>
<td>X</td>
<td>1</td>
<td>Active-pending</td>
</tr>
</tbody>
</table>

**H3.2.3 Using Halting Step**

To step a single instruction the PE must be in Debug state:

1. The debugger sets EDECR.SS to 1 to enable Halting step.
2. The debugger signals the PE to exit Debug state with DLR set to the address of the instruction being stepped. The PE clears EDESR.SS to 0 and the Halting Step state machine enter the active-not-pending state.
3. The PE executes the instruction being stepped. If an exception is taken to a state where halting is prohibited, then EDESR.SS is always correct for the preferred return address of the exception.
4. The PE enters Debug state before executing the next instruction and the step is complete.

**H3.2.4 Detailed Halting Step state machine behavior**

The behavior of the Halting Step state machine is described in the following sections:

- Entering the active-not-pending state on page H3-5024.
- PE behavior in the active-not-pending state on page H3-5024.
- Entering the active-pending state on page H3-5025.
- PE behavior in the inactive state when in Non-debug state on page H3-5026.
- PE behavior in Debug state on page H3-5026.
**Entering the active-not-pending state**

The PE enters the active-not-pending state:

- By exiting Debug state with EDECR.SS == 1.
- By an exception return from a state where halting is prohibited to a state where halting is allowed with EDECR.SS == 1 and EDESR.SS == 0.
- As described in *Synchronization and the Halting Step state machine* on page H3-5026.

**PE behavior in the active-not-pending state**

When the PE is in the active-not-pending state it does one of the following:

- It executes one instruction and does one of the following:
  - Completes it without generating a synchronous exception.
  - Generates a synchronous exception.
  - Generates a debug event that causes entry to Debug state.
- It takes an asynchronous exception without executing any instruction.
- It takes an asynchronous debug event into Debug state.

**If no exception or debug event is generated**

If no exception or debug event is generated the PE sets EDESR.SS to 1. This means that the Halting Step state machine advances to the active-pending state.

**If an exception or debug event is generated**

The PE sets EDESR.SS according to all of the following:

- The type of exception.
- The target Exception level of the exception.
- If the exception is taken to Secure state, whether halting is prohibited in Secure state. This is determined by the result of ExternalSecureInvasiveDebugEnabled().

If an exception or debug event is generated, the PE sets EDESR.SS to 1 if one of the following applies:

- A synchronous exception is generated by the instruction and one of the following applies:
  - The exception is taken to EL1 or EL2.
  - The exception is not an SMC exception and ExternalSecureInvasiveDebugEnabled() == TRUE.
  - The exception is an SMC exception.
- An asynchronous exception is generated before executing an instruction and this is either:
  - Taken to EL1 or EL2.
  - Taken to EL3 and ExternalSecureInvasiveDebugEnabled() == TRUE.
- A PE reset occurs.

Otherwise EDESR.SS is unchanged. This happens when:

- No instruction is executed because either:
  - An asynchronous exception is taken to EL3 and ExternalSecureInvasiveDebugEnabled() == FALSE.
  - An asynchronous debug event causes entry to Debug state.
- An instruction is executed and either:
  - Generates a synchronous exception other than an SMC exception which is taken to EL3, and ExternalSecureInvasiveDebugEnabled() == FALSE.
  - Generates a synchronous debug event and causes entry to Debug state.
If halting is prohibited after taking the exception or debug event, then the Halting Step state machine advances to the inactive state. Otherwise the Halting Step state machine advances to the active-pending state.

--- Note ---

The underlying criteria for the value of EDESR.SS on an exception are:

- Whether halting is allowed at the target of the exception. If halting is allowed, the PE must step into the exception. If halting is prohibited, the PE must step over the exception.
- Whether the preferred return address of the exception is the instruction itself or the next instruction, if the PE steps over the exception.

Table H3-4 shows the behavior of the active-not-pending state. The letter X indicates that ExternalSecureInvasiveDebugEnabled() can be either TRUE or FALSE.

<table>
<thead>
<tr>

<td>X</td>
<td>0</td>
</tr>
</tbody>
</table>

**Entering the active-pending state**

The PE enters the active-pending state by one of the following:

- From the active-not-pending state by:
  - Executing an instruction without taking an exception.
  - Taking an exception so that the PE remains in a state where halting is allowed.
- An exception return from a state where halting is prohibited when EDESR.SS == 1.

--- Note ---

That is, an exception return from Secure state with ExternalSecureInvasiveDebugEnabled() == FALSE to Non-secure state with ExternalInvasiveDebugEnabled() == TRUE.

- A reset when the value of EDECR.SS == 1, regardless of the state the PE was in before the reset occurred.
- Following the description in Synchronization and the Halting Step state machine on page H3-5026.

When the PE is in the active-pending state, it enters Debug state before executing an instruction. However, if ExternalSecureInvasiveDebugEnabled() == FALSE, the architecture does not define the prioritization of this Debug state entry with respect to any pending asynchronous exception that is taken from Non-secure state to EL3.

If an exception is prioritized over the halt, then EDESR.SS is unchanged. On return from the exception the Halting Step state machine re-enters the active-pending state.
The entry into Debug state has higher priority than all other types of exception, including all other asynchronous exceptions.

Note
This means that it is possible to step a reentrant exception in the exception vector table.

PE behavior in the inactive state when in Non-debug state

EDESR.SS is not updated by the execution of an instruction or the taking of an exception when Halting Step is inactive. This means that EDESR.SS is not changed by an exception handled in a state where halting is prohibited.

On return to a state where halting is allowed, the Halting Step state machine is restored either to the active-pending state or the active-not-pending state, depending on the value of EDESR.SS. The return to a state where halting is allowed is normally by an exception return, which is a Context synchronization operation.

See also Synchronization and the Halting Step state machine.

PE behavior in Debug state

Halting Step is inactive in Debug state because halting is prohibited, see Halting allowed and halting prohibited on page H2-4977.

Entry to Debug state does not change EDESR.SS.

EDESR.SS is cleared to 0 on exiting Debug state as the result of a restart request. If EDECR.SS == 1, Halting Step enters the active-not-pending state.

Note
This means that EDESR.SS is never cleared to 0 by the execution of an instruction in Debug state, or by taking an exception when in Debug state as described in PE behavior in the active-not-pending state on page H3-5024, because the Halting Step state machine is not in the active-not-pending state. EDESR.SS can be cleared by a write to EDESR, see the register description.

However, if the PE exits Debug state as the result of a PE reset and EDECR.SS == 1, then Halting Step immediately enters the active-pending state, as EDESR.SS is set to the value of EDECR.SS.

H3.2.5 Synchronization and the Halting Step state machine

The Halting Step state machine also changes state if:

• Halting becomes allowed or prohibited other than by exit from Debug state, an exception return, or taking an exception. This means that halting becomes allowed or prohibited because:
  — The security state changes without an exception return. See State and mode changes without explicit context synchronization operations on page G2-4018.
  — The external authentication interface changes.
  — The OS Double Lock status, DoubleLockStatus(), changes.
• A write to EDECR when the PE is in Non-debug state changes the value of EDECR.SS.
• A write to EDESR when the PE is in Non-debug state clears EDESR.SS to 0.

These operations are guaranteed to take effect only after a Context synchronization operation.

The PE must perform the required behavior of the new state before or immediately following the next Context synchronization operation, but it is not required to do so immediately. This means that the PE can perform the required behavior of the old state before the next Context synchronization operation. This is illustrated in Example H3-1 on page H3-5027 and Example H3-2 on page H3-5027.
Example H3-1 Synchronization requirements 1

EDECR.SS is set to 1 in Debug state, requesting the active-not-pending state on exit from Debug state. On exit from Debug state the PE immediately takes an exception to Secure state. If ExternalSecureInvasiveDebugEnabled() == FALSE, meaning that halting is prohibited in Secure state. The PE does not step any instructions but executes the software in Secure state as normal. EDESRS.SS remains set to 0. If ExternalSecureInvasiveDebugEnabled() subsequently becomes TRUE, meaning that halting is now allowed, the PE must perform the required behavior of the active-not-pending state before or immediately following the next Context synchronization operation, but it is not required to do so immediately.

Example H3-2 Synchronization requirements 2

EDECR.SS is set to 1 in Debug state. On exit from Debug the PE executes an MSR instruction that sets OSDLR_EL1.DLK to 1 and DoubleLockStatus() becomes TRUE. This change requires a Context synchronization operation to guarantee its effect, meaning it is CONSTRAINED UNPREDICTABLE whether:

- Halting is allowed:
  - The PE enters Debug state on the next instruction.
- Halting is prohibited:
  - The PE does not enter Debug state.

The value in EDESRS.SS depends on whether halting was allowed or prohibited when the write to OSDLR_EL1.DLK completed, and so it might be 0 or 1. If a second MSR instruction clears OSDLR_EL1.DLK to 0, the PE must perform the required behavior of the state indicated by EDESRS.SS before or immediately following the next Context synchronization operation, but it is not required to do so immediately.

See also Synchronization and Halting debug events on page H3-5038.

H3.2.6 Stepping T32 IT instructions

The ARMv8 architecture permits a combination of one T32 IT instruction and another 16-bit T32 instruction to be treated as one 32-bit instruction when the value of SCTLR.ITD, SCTLR_EL1.ITD or HSCTLR.ITD as applicable, is 1.

For the purpose of stepping an item, it is IMPLEMENTATION DEFINED whether:

- The PE considers such a pair of instructions to be one instruction.
- The PE considers such a pair of instructions to be two instructions.

It is IMPLEMENTATION DEFINED whether this behavior depends on the value of the applicable ITD bit. For example:

- The debug logic might consider such a pair of instructions to be one instruction, regardless of the state of SCTLR.ITD, SCTLR_EL1.ITD, or HSCTLR.ITD.
- The debug logic might consider such a pair of instructions to be two instructions, regardless of the state of SCTLR.ITD, SCTLR_EL1.ITD, or HSCTLR.ITD.
- The debug logic might consider such a pair of instructions to be one instruction when SCTLR.ITD, SCTLR_EL1.ITD, or HSCTLR.ITD is set to 1, and two instructions when the ITD bit is set to 0.
H3.2.7 Disabling interrupts while stepping

When using Halting Step, the sequence of entering Debug state, interacting with the debugger, and then exiting Debug state for each instruction reduces the rate at which the PE executes instructions. However, the rate at which certain interrupts, such as timer interrupts, are generated might be fixed by the system. This means it might be necessary to disable interrupts while using Halting Step by setting EDSCR.INTdis, to allow the code being debugged to make forward progress.

H3.2.8 Syndrome information on Halting Step

Three EDSCR.STATUS encodings record different scenarios for entering Debug state on a Halting Step debug event:

**Halting Step, normal**

An instruction other than a Load-Exclusive instruction was stepped.

**Halting Step, exclusive**

A Load-Exclusive instruction was stepped.

**Halting Step, no syndrome**

The syndrome data is not available.

If the PE enters Debug state due to a Halting Step debug event immediately after stepping an instruction in the active-not-pending state, EDSCR.STATUS is set to either:

- Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

If the stepped instruction was a conditional Load-Exclusive instruction that failed its condition code test, EDSCR.STATUS is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, normal, or Halting Step, exclusive.

Otherwise the PE enters Debug state without stepping an instruction. This means that the Halting Step state machine enters the active-pending state directly from the inactive state, without going through active-not-pending state. In this case, EDSCR.STATUS is set to Halting Step, no syndrome. This happens when:

- The PE enters directly into the active-pending state on an exception return to Non-secure state from EL3 when Halting is prohibited in Secure state.
- A pending asynchronous exception is taken before the instruction is executed.
- The active-pending state is entered for other reasons. See Synchronization and the Halting Step state machine on page H3-5026

In these cases the debugger cannot determine whether the instruction that was stepped was a Load-Exclusive instruction.

In addition, EDSCR.STATUS is set to one of a CONSTRAINED UNPREDICTABLE choice if:

- The instruction being stepped generated a synchronous exception, meaning that it was not completed.
  In this case EDSCR.STATUS is set to a CONSTRAINED UNPREDICTABLE choice of:
    - Halting Step, no syndrome, or Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
    - Halting Step, no syndrome, or Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.
  - The instruction that was stepped was an exception return instruction or an ISB. As these instructions are not in the Load-Exclusive instructions, EDSCR.STATUS is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.
In all cases, if EDSCR.STATUS is not set to Halting Step, no syndrome, then it must indicate whether the stepped instruction was a Load-Exclusive instruction by setting EDSCR.STATUS to Halting Step, normal or Halting Step, exclusive.

--- Note ---
In an implementation that always sets EDSCR.STATUS to Halting Step, no syndrome is not compliant.

---

**Pseudocode description of Halting Step debug events**

There are two pseudocode functions for Halting Step debug events:

- **RunHaltingStep()**: This is called after an instruction has executed and any exception generated by the instruction is taken. It is also called after taking a reset before executing any instructions. That is, reset is treated like an asynchronous exception, even if EDECR.RCE == 1. RunHaltingStep() affects the next instruction.

- **CheckHaltingDebugStep()**: This is called before the next instruction is executed. If a step is pending, it generates the debug event.

```c
// RunHaltingStep()
// ================
RunHaltingStep(boolean exception_generated, bits(2) exception_target, boolean syscall, boolean reset)
// "exception_generated" is TRUE if the previous instruction generated a synchronous exception
// or was cancelled by an asynchronous exception.
// if "exception_generated" == TRUE then "exception_target" is the target of the exception, and
// "syscall" is TRUE if the exception is a synchronous exception where the preferred return
// address is the instruction following that which generated the exception.
// "reset" = TRUE if exiting reset state into the highest EL.
if reset then assert !Halted();             // Cannot come out of reset halted
active = EDECR.SS == '1' && !Halted();
if active && reset then                     // Coming out of reset with EDECR.SS set.
    EDESR.SS = '1';
elsif active && HaltingAllowed() then
    if exception_generated && exception_target == EL3 then
        advance = syscall || ExternalSecureInvasiveDebugEnabled();
    else
        advance = TRUE;
    if advance then EDESR.SS = '1';
    return;

// CheckHaltingStep()
// ==================
// Check whether EDESR.SS has been set by Halting Step
CheckHaltingStep()
if HaltingAllowed() && EDESR.SS == '1' then
    if HaltingStep_DidNotStep() then
        Halt(DebugHalt_Step_NoSyndrome);
    elsif HaltingStep_SteppedEX() then
        Halt(DebugHalt_Step_Exclusive);
    else
        Halt(DebugHalt_Step_Normal);
```
H3.3 Halt Instruction debug event

A Halt Instruction debug event is generated when EDSCR.HDE == 1, halting is allowed, and software executes the Halting software breakpoint instruction, HLT.

The pseudocode for Halt Instruction Debug events is described in HLT on page C6-503 for A64 and HLT on page F7-2745 for A32 and T32.

HLT never generates a debug exception. It is treated as UNDEFINED if EDSCR.HDE == 0, or if halting is prohibited.

A debugger can replace a program instruction with a Halt instruction to generate a Halting Software Breakpoint. Debuggers that use the HLT instruction must be aware of the ARMv8-A rules for concurrent modification of executable code, CMODX. The rules for concurrent modification and execution of instructions do not allow one thread of execution or an external debugger to replace an instruction with an HLT instruction when these same instructions are being executed by a different thread of execution. See Concurrent modification and execution of instructions on page B2-83.

The T32 HLT instruction is unconditionally executed inside an IT block, even when it is treated as UNDEFINED. The A32 HLT instruction is CONSTRAINED UNPREDICTABLE if the condition code field is not 0b1110, with the set of behaviors the same as for BKPT. See Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors.

The HLT instruction is part of the external debug solution for ARMv8-A. As such, the presence of the HLT instruction is not indicated in the ID registers. In particular, the AArch32 CP15 register ID_ISAR0.Debug does not indicate the presence of the HLT instruction.

H3.3.1 HLT instructions as the first instruction in a T32 IT block

The ARMv8 architecture defines combinations of IT and a single 16-bit T32 instruction that can be treated as a 32-bit instruction when SCTLR.ITD, SCTLR_EL1.ITD or HSCTLR.ITD, as applicable, is set to 1.

The T32 HLT instruction is not such an instruction. If the first instruction in an IT block is an HLT instruction, then the behavior of the instruction depends on the value of SCTLR.ITD, SCTLR_EL1.ITD or HSCTLR.ITD, as applicable:

- If the ITD bit is set to 1, then the combination is treated as UNDEFINED and an Undefined Instruction exception is generated either by the IT instruction or by the HLT instruction.
- If the ITD bit is set to 0, then the HLT instruction either:
  - Is treated as UNDEFINED and generates an Undefined Instruction exception.
  - Generates an HLT Instruction debug event.

To set an HLT Instruction debug event on the first instruction of an IT block, debuggers must replace the IT instruction with an HLT instruction to ensure consistent behavior.

An HLT instruction is always unconditional, even within an IT block.
H3.4 Exception Catch debug event

Exception Catch debug events:

- Are generated when the corresponding bit in the Exception Catch Control Register, EDECCR, is set to 1 on all entries to a given Exception level. This means:
  - Exceptions taken to the Exception level.
  - Exception returns to the Exception level.
  - Entry to the Exception level due to reset. This is an overlap with a Reset Catch debug event. See Reset Catch debug event on page H3-5036.

- Are taken synchronously, after entry to the Exception level.
- Ignore the Execution state of the target Exception level.
- Are ignored if halting is prohibited.

The EDECCR contains two fields:

- One field for Non-secure state.
- One field for Secure state.

Each field contains one bit for each Exception level in that state. Bits corresponding to Exception levels that are not implemented are RES0. See EDECCR, External Debug Exception Catch Control Register on page H9-5160.

Note

- **EDECCR** does not replace DBGVCR:
  - DBGVCR is retained in AArch32 state for backwards compatibility.
  - DBGVCR is ignored in AArch64 state and never generates entries to Debug state.
  - DBGVCR cannot be accessed by the external debug interface.
- **EDECCR** is only visible as OSECCR_EL1 by System Register instructions in AArch64 state, and as DBGOSECCR by CP14 register access instructions in AArch32 state, when the OS Lock is locked to allow software to save and restore it over a powerdown.
- Exception Catch debug events are not disabled when the OS Lock is locked.

For an Exception Catch debug event generated after taking an exception to a trapped Exception level:

- The PE must not fetch instructions from the vector address before entering Debug state, if the translation regime MMU at the target Exception level is disabled.
- On entering Debug state:
  - The current Exception level is the target Exception level of the exception.
  - The ELR, SPSR, ESR, and other syndrome registers contain information about the exception.
  - DLR contains the exception vector address.

H3.4.1 Prioritization of Exception Catch debug events

Exception Catch debug events have a higher priority than all synchronous exceptions other than Software Step exceptions on page D2-1671 and a lower priority than Reset Catch debug event on page H3-5036. It is IMPLEMENTATION DEFINED whether Exception Catch debug events are higher or lower priority than both:

- Software Step exceptions on page D2-1671.
- Halting Step debug event on page H3-5020.
As described in Synchronous exception prioritization on page D1-1546, an exception trapping form of a Vector Catch debug event might generate a second debug exception as part of the exception entry, before the Exception Catch debug event is taken. See Vector Catch exceptions on page D2-1670 or Vector Catch exceptions on page G2-4009.

A second unmasked asynchronous exception can be taken before the PE enters Debug state. If this second exception does not generate an Exception Catch debug event, the exception handler executed at the higher Exception level later returns to the trapped Exception level, causing the Exception Catch debug event to be generated again.

See also Debug state entry and debug event prioritization on page H2-4979.

### H3.4.2 UNPREDICTABLE generation of Exception Catch debug events

When the PE is executing code at a given Exception level and the corresponding EDECCR bit is 1, it is CONSTRAINED UNPREDICTABLE whether an Exception Catch debug event is generated.

--- Note ---

It is possible to generate Exception Catch debug events:
- As a trap on all instruction fetches from the trapped Exception level as part of an instruction fetch.
- On entry to the Exception level, as described in Detailed Halting Step state machine behavior on page H3-5023.

This is similar to the implementation options allowed for Vector Catch debug events. The architecture does not require that the event is generated following an ISB operation executed at the Exception level.

---

Examples of this are:
- If the debugger writes to EDECCR so that the current Exception level is trapped.
- If the OS restore code writes to OSECCR so that the current Exception level is trapped.
- If the code executing in AArch32 state changes the Exception level or security state other than by an exception return, and the target Exception level is trapped. See State and mode changes without explicit context synchronization operations on page G2-4018.

### H3.4.3 Examples of Exception Catch debug events

If EDECCR == 0x20, meaning that the Exception Catch debug event is enabled for Non-secure EL1, then the following exceptions generate Exception Catch debug events:
- An exception taken from Non-secure EL0 to Non-secure EL1.
- An exception return from EL2 to Non-secure EL1.
- An exception return from EL3 to Non-secure EL1.

For example, on taking a Data Abort exception from Non-secure EL0 to Non-secure EL1, using AArch64:
- ELR_EL1 and SPSR_EL1 are written with the preferred return address and PE state for a return to EL0.
- ESR_EL1 and FAR_EL1 are written with the syndrome information for the exception.
- DLR_EL0 is set to VBAR_EL1 + 0x400, the synchronous exception vector.
- DSPSR_EL0 is written with the PE state for an exit to EL1.

The following do not generate Exception Catch debug events:
- An exception taken from Non-secure EL0 to EL2 or EL3.
- An exception return from EL2 to Non-secure EL0.
- An exception taken from Secure EL0 to Secure EL1.
- An exception return from EL3 to Secure EL1.
**Pseudocode description of Exception Catch debug events**

The pseudocode for the `CheckExceptionCatch()` function is as follows:

```plaintext
// CheckExceptionCatch()
// =====================
// Check whether an Exception Catch debug event is set on the current Exception level

CheckExceptionCatch()
  // Called after taking an exception, that is, such that IsSecure() and PSTATE.EL are correct
  // for the exception target.
  base = if IsSecure() then 0 else 4;
  if HaltingAllowed() && EDECCR<UInt(PSTATE.EL) + base> == '1' then
    Halt(DebugHalt_ExceptionCatch);
```
H3.5 External Debug Request debug event

External Debug Request debug events are asynchronous debug events.

An External Debug Request debug event is generated when signaled by the embedded cross-trigger. See Chapter H5 The Embedded Cross Trigger Interface.

--- Note ---
ARMv8-A requires the implementation of an embedded cross-trigger.

An implementation might also support IMPLEMENTATION DEFINED ways of generating an External Debug Request debug event.

If an External Debug Request debug event is being asserted at the point where a reset is taken, then the PE enters Debug state before it completes execution of the first instruction following the reset, provided that the state into which the PE resets allows halting.

H3.5.1 Pseudocode description of External Debug Request debug events

The pseudocode for the ExternalDebugRequest() function is as follows:

```
// ExternalDebugRequest()
// ======================

ExternalDebugRequest()
if HaltingAllowed() then
    Halt(DebugHalt_EDBGRQ);
    // Otherwise the CTI continues to assert the debug request until it is taken.
```

H3.6 OS Unlock Catch debug event

An OS Unlock Catch debug event is generated when EDECR.OSUCE == 1 and the state of the OS Lock changes from locked to unlocked.

When the OS Unlock Catch debug event is generated, it is recorded by setting EDESR.OSUC to 1, meaning it immediately becomes pending. However, it is not guaranteed to be taken immediately. See Synchronization and Halting debug events on page H3-5038.

OS Unlock Catch debug events are not generated if the OS Lock is unlocked when the PE is in Debug state. See also:

- Debug behavior when the OS Lock is unlocked on page H6-5088.
- EDECR, External Debug Execution Control Register on page H9-5162.
- EDESR, External Debug Event Status Register on page H9-5164.

EDESR.OSUC is cleared to 0 on a Warm reset and on exiting Debug state.

H3.6.1 Using the OS Unlock Catch debug event

If the debugger attempts to access a debug register when the Core power down domain is completely off or in a low-power state in which the core power domain registers cannot be accessed, and that access returns an error, then the debugger must retry the access. However, if the Core power domain is regularly powered down, this can lead to unreliable debugger behavior.

The debugger can program a Reset Catch debug event to halt the PE when it has powered up, and can program the debug registers from Debug state. However, if the PE boot software restores the debug registers, as described in Debug OS Save and Restore sequences on page H6-5086, then newly written values are overwritten by the restore sequence.

The debugger can program an OS Unlock Catch debug event to halt the PE after the restore sequence has completed, and program the debug registers from Debug state.

H3.6.2 Pseudocode description of OS Unlock Catch debug event

The CheckOSUnlockCatch() function is called when the OS Lock is unlocked.

```c
// CheckOSUnlockCatch()
// ====================
// Called on unlocking the OS Lock to pend an OS Unlock Catch debug event

CheckOSUnlockCatch()
    if EDECR.OSUCE == '1' && !Halted() then EDESR.OSUC = '1';
```

The CheckPendingOSUnlockCatch() function is called before an instruction is executed. If an OS Unlock Catch is pending, it generates the debug event.

```c
// CheckPendingOSUnlockCatch()
// ===========================
// Check whether EDESR.OSUC has been set by an OS Unlock Catch debug event

CheckPendingOSUnlockCatch()
    if HaltingAllowed() && EDESR.OSUC == '1' then
        Halt(DebugHalt_OSUnlockCatch);
```
H3.7 Reset Catch debug event

A Reset Catch debug event is generated when EDECR.RCE = 1 and the PE exits reset state. When the Reset Catch debug event is generated, it is recorded by setting EDESR.RC to 1.

If halting is allowed when the event is generated, the Reset Catch debug event is taken immediately and synchronously. On entering Debug state, DLR has the address of the reset vector. The PE must not fetch any instructions from memory.

Otherwise, the Reset Catch debug event is pended and taken when halting is allowed. See also:
- **Synchronization and Halting debug events** on page H3-5038.
- **EDECR, External Debug Execution Control Register** on page H9-5162.
- **EDESR, External Debug Event Status Register** on page H9-5164.

This means that EDESR.RC is set to the value of EDECR.RCE on a Warm reset. EDESR.RC is cleared to 0 on exiting Debug state.

### H3.7.1 Pseudocode description of Reset Catch debug event

The CheckResetCatch() function is called after reset before executing any instruction.

```
// CheckResetCatch()
// =================
// Called after reset
CheckResetCatch()
    if EDECR.RCE == '1' then
        EDESR.RC = '1';
        // If halting is allowed then halt immediately
        if HaltingAllowed() then Halt(DebugHalt_ResetCatch);
```

The CheckPendingResetCatch() function is called before an instruction is executed. If a Reset Catch is pending, it generates the Reset Catch debug event.

```
// CheckPendingResetCatch()
// ========================
// Check whether EDESR.RC has been set by a Reset Catch debug event
CheckPendingResetCatch()
    if HaltingAllowed() && EDESR.RC == '1' then
        Halt(DebugHalt_ResetCatch);
```
H3.8 Software Access debug event

When the value of EDSCR.TDA == 1, software access to the following debug AArch64 System registers and AArch32 CP14 registers cause a trap to Debug state:

- The Breakpoint Value Registers, DBGVBR.
- The Breakpoint Control Registers, DBGCRR.
- The Watchpoint Value Registers, DBGWVR.
- The Watchpoint Control Registers, DBGWCR.

However, EDSCR.TDA is ignored if one of:

- The value of OSLSR.OSLK == 1, meaning that the OS Lock is locked.
- Halting is prohibited. See Halting allowed and halting prohibited on page H2-4977.
- The register access generates an exception.

--- Note ---

- DBGPRCR.CORENPDRQ (Core No-powerdown Request), DCC registers, and CLAIM tag bits are also shared, but are deliberately excluded from this list.

- Only accesses as System registers in AArch64 state or CP14 registers in AArch32 state generate a trap. Accesses to the memory-mapped interface by a PE are not trapped.

H3.8.1 Pseudocode description of Software Access debug event

The pseudocode for CheckSoftwareAccessToDebugRegisters() is as follows:

```c
// CheckSoftwareAccessToDebugRegisters()
// =====================================
// Check for access to Breakpoint and Watchpoint registers.
CheckSoftwareAccessToDebugRegisters()

os_lock = (if ELUsingAArch32(EL1) then DBGOSLSR.OSLK else OSLSR_EL1.OSLK);
if HaltingAllowed() && EDSCR.TDA == '1' && os_lock == '0' then
  Halt(DebugHalt_SoftwareAccess);
```

---
H3.9 Synchronization and Halting debug events

The behavior of external debug depends on:

- Indirect reads of:
  - External debug registers.
  - System registers, including system debug registers.
  - Special-purpose registers.
- The state of the external authentication interface.

This means that any change to these registers or the external authentication interface requires explicit synchronization by a Context synchronization operation before the change takes effect. This ensures that for instructions appearing in program order after the change, the change affects the following:

- The generation and behavior of Software debug events. See Synchronization and debug exceptions on page D2-1686 for exceptions taken from AArch64 state, or Synchronization and debug exceptions on page G2-4017 for exceptions taken from AArch32 state.
- The generation of all Halting debug events.
- Taking a pending Halting debug event or other asynchronous Debug event. See:
  - Pending Halting debug events.
  - Taking Halting debug events asynchronously on page H3-5039.
- The behavior of the Halting Step state machine. See Synchronization and the Halting Step state machine on page H3-5026.

If there is an instruction between the change and the Context synchronization operation, it is CONSTRAINED UNPREDICTABLE whether the PE uses the old state or the new state.

For some registers, all read and write accesses that update the register occur in program order, without any additional synchronization, but others require an explicit Context synchronization operation. For more information on the synchronization of register updates see:

- Synchronization requirements for System registers on page D7-1902.
- Synchronization of changes to the external debug registers on page H8-5102.
- State and mode changes without explicit context synchronization operations on page G2-4018.

A change on the external authentication interface is typically asynchronous to software and can happen without a Context synchronization operation.

External Debug Request debug events must be taken in finite time, without requiring the synchronization of any necessary change to the external authentication interface.

Example H3-3 shows an example of the synchronization requirements.

Example H3-3 Synchronization requirements

Secure software locks up in a tight loop, so it executes indefinitely without any synchronization operations. An External debug request must be able to break the PE out of that loop. This is a requirement even if DBGEN or SPIDEN or both are LOW on entry to the loop, meaning that halting is prohibited, and are only asserted HIGH later.

H3.9.1 Pending Halting debug events

A pending Halting debug event is taken when halting becomes allowed. This can happen without a Context synchronization operation if:

- The PE enters Non-secure state with ExternalInvasiveDebugEnabled() == TRUE, and this is not the result of an exception return. See State and mode changes without explicit context synchronization operations on page G2-4018.
- A change on the external authentication interface means halting becomes allowed in the current state.
• The OS Double Lock status, doubleLockStatus() becomes FALSE. For example, this can happen when software clears OSDLR.DLK to 0 or sets DBGPRCR.CORENPDRQ to 1.

• The debug event is an OS Unlock Catch debug event. OS Unlock Catch debug events are generated in a pending state, rather than taken synchronously.

In these cases a pending Halting debug event is taken asynchronously.

H3.9.2 Taking Halting debug events asynchronously

The ARM architecture does not define when Halting debug events that are taken asynchronously are taken.

Any Halting debug event that is observed as pending in the EDSR before a Context synchronization operation, or an External Debug Request debug event that is asserted before a Context synchronization operation, is taken and the PE enters Debug state before the first instruction following the Context synchronization operation completes its execution. This is only possible if halting is allowed after completion of the Context synchronization operation.

If the first instruction after the Context synchronization operation generates a synchronous exception, or an asynchronous exception is also pending, then the architecture does not define the order in which the debug event and the exception or exceptions are taken, unless both:

• A Halting Step debug event is pending. EDSR.SS == 1.
• The Context synchronization operation is an exception return from a state where halting is prohibited to a state where halting is allowed.

Note

This applies to an exception return from Secure state with ExternalSecureInvasiveDebugEnabled() == FALSE to Non-secure state with ExternalInvasiveDebugEnabled() == TRUE.

In this case the order in which the debug events are handled is specified to avoid a double-step. See Entering the active-pending state on page H3-5025.

An External Debug Request debug event that is being asserted when the PE comes out of reset is taken, and the PE enters Debug state before the first instruction after the reset completes its execution, provided that halting is allowed when the PE exits reset state

Note

These rules are based on the rules that apply to taking asynchronous exceptions. See Asynchronous exception types, routing, masking and priorities on page D1-1552.
H3 Halting Debug Events
H3.9 Synchronization and Halting debug events
Chapter H4
The Debug Communication Channel and Instruction Transfer Register

This chapter describes communication between a debugger and the implemented debug logic, using the Debug Communications Channel (DCC) and the Instruction Transfer Register (ITR), and associated control flags. It contains the following sections:

• Introduction on page H4-5042.
• DCC and ITR registers on page H4-5043.
• DCC and ITR access modes on page H4-5045.
• Flow control of the DCC and ITR registers on page H4-5049.
• Synchronization of DCC and ITR accesses on page H4-5053.
• Interrupt-driven use of the DCC on page H4-5058.
• Pseudocode description of the operation of the DCC and ITR registers on page H4-5059.

Note

Where necessary Table J11-1 on page J11-5816 disambiguates the general register references used in this chapter.
H4.1 Introduction

The Debug Communications Channel, DCC, is a channel for passing data between the PE and an external agent, such as a debugger. The DCC provides a communications channel between:

- An external debugger, described as the debug host.
- The debug implementation on the PE, described as the debug target.

The DCC can be used:

- As a 32-bit full-duplex channel.
- As a 64-bit half-duplex channel.

The DCC is an essential part of Debug state operation and can also be used in Non-debug state.

The Instruction Transfer Register, ITR, passes instructions to the PE to execute in Debug state.

The PE includes flow-control mechanisms for both the DCC and ITR.
H4.2 DCC and ITR registers

The DCC comprises data transfer registers, the DTRs, and associated flow-control flags. The data transfer registers are DTRRX and DTRTX.

The ITR comprises a single register, EDITR, and associated flow-control flags.

In AArch64 state, software can access the data transfer registers as:

- A receive and transmit pair for 32-bit full duplex operation:
  - The write-only DBGDTRTX_EL0 register to transmit data.
  - The read-only DBGDTRRX_EL0 register to receive data.
- A single 64-bit read/write register, DBGDTR_EL0, for 64-bit half-duplex operation.
- The read/write OSDTRTX_EL1 and OSDTRRX_EL1 registers for save and restore.

In AArch32 state, software can only access the data transfer registers as:

- A receive and transmit pair, for 32-bit full duplex operation:
  - The write-only DBGDTRTXint register to transmit data.
  - The read-only DBGDTRRXint register to receive data.
- The read/write DBGDTRTXext and DBGDTRRXext registers for save and restore.

The data transfer registers are also accessible by the external debug interface as a pair of 32-bit registers, DBGDTRRX_EL0 and DBGDTRTX_EL0. Both registers are read/write, allowing both 32-bit full-duplex and 64-bit half-duplex operation.

The DCC flow-control flags are EDSCR.\{RXfull, TXfull, RXO, TXU\}:

- The RXfull and TXfull ready flags are used for flow-control and are visible to software in the debug system registers in DCCSR.
- The RX overrun flag, RXO, and the TX underrun flag, TXU, report flow-control errors.
- The flow-control flags are also accessible by software as simple read/write bits for saving and restoring over a powerdown when the OS Lock is locked in DSCR.
- The flow-control flags are accessible from the external debug interface in EDSCR.

Figure H4-1 on page H4-5044 shows the system register and external debug interface views of the EDSCR and DTR registers in both AArch64 state and AArch32 state. These figures do not include the save and restore views.
EDITR and the ITR flow-control flags, EDSCR, {ITE, ITO} are accessible only by the external debug interface:

- The EDITR specifies an instruction to execute in Debug state.
- The ITR empty flag, ITE, is used for flow-control.
- The ITR overrun flag, ITO, reports flow-control errors.

The sticky overflow flag, EDSCR.ERR, is used by both the DCC and ITR to report flow-control errors.
H4.3 DCC and ITR access modes

The DCC and ITR support two access modes:

- **Normal access mode**, when EDSCR.MA == 0 or the PE is in Non-debug state.
- **Memory access mode on page H4-5046**, when EDSCR.MA == 1 and the PE is in Debug state.

H4.3.1 Normal access mode

The Normal access mode allows use of the DCC as a communications channel between target and host. It also allows the use of the ITR for issuing instructions to the PE in Debug state.

In Normal access mode, if there is no overrun or underrun, the following occurs:

**For accesses by software:**

- Direct writes to DBGDTRTX update the value in DTRTX and indirectly write 1 to TXfull.
- Direct reads from DBGDTRRX return the value in DTRRX and indirectly write 0 to RXfull.
- In AArch64 state, direct writes to DBGDTR_EL0 update both DTRTX and DTRRX, indirectly write 1 to TXfull, and do not change RXfull:
  - DTRTX is set from bits[31:0] of the transfer register.
  - DTRRX is set from bits[63:32] of the transfer register.
- In AArch64 state, direct reads from DBGDTR_EL0 return the concatenation of DTRRX and DTRTX, indirectly write 0 to RXfull, and do not change TXfull:
  - Bits[31:0] of the transfer register are set from DTRRX.
  - Bits[63:32] of the transfer register are set from DTRTX.

**Note**

For DBGDTR_EL0, the word order is reversed for reads with respect to writes.

Software reads TXfull and RXfull using DCCSR.

**For accesses by the external debug interface:**

- Writes to EDITR trigger the instruction to be executed if the PE is in Debug state:
  - If the PE is in AArch64 state, this is an A64 instruction.
  - If the PE is in AArch32 state, this is a T32 instruction. The T32 instruction is a pair of halfwords where the first halfword is taken from the lower 16-bits, and the second halfword is taken from the upper 16-bits.
- Reads of DBGDTRTX_EL0 return the value in DTRTX and indirectly write 0 to TXfull.
- Writes to DBGDTRTX_EL0 update the value in DTRTX and do not change TXfull.
- Reads of DBGDTRRX_EL0 return the value in DTRRX and do not change RXfull.
- Writes to DBGDTRRX_EL0 update the value in DTRRX and indirectly write 1 to RXfull.

TXfull and RXfull are visible to the external debug interface in EDSCR.

The PE detects overrun and underrun by the external debug interface, and records errors in EDSCR.{TXU, RXO, ITO, ERR}. See Flow control of the DCC and ITR registers on page H4-5049.

See also Synchronization of DCC and ITR accesses on page H4-5053.
H4.3.2 Memory access mode

When the PE is in Debug state, a special Memory access mode can be selected to accelerate word-aligned block reads or writes of memory by an external debugger. Memory access mode can only be enabled in Debug state, and no instructions can be issued directly by the debugger when in Memory access mode.

If there is no overrun or underrun when in Memory access mode, an access by the external debug interface results in the following:

- **External reads from DBGDTRTX_EL0 cause:**
  1. The existing value in DTRTX to be returned. This clears EDSCR.TXfull to 0.
  2. The equivalent of `LDR W1,[X0],#4` if in AArch64 state, or `LDR R1,[R0],#4` if in AArch32 state, to be executed.
  3. The equivalent of the MSR DBGDTRTX_EL0,X1 instruction, if in AArch64 state, or the MCR p14,0,R1,c0,c5,0 instruction, if in AArch32 state, to be executed.
  4. EDSCR.{TXfull, ITE} to be set to {1,1}, and X1 or R1 to be set to an UNKNOWN value.

- **External writes to DBGDTRRX_EL0 cause:**
  1. The value in DTRRX to be updated. This sets EDSCR.RXfull to 1.
  2. The equivalent of the instruction `MRS X1,DBGDTRRX_EL0`, if in AArch64 state, or `MRC p14,0,R1,c0,c5,0` if in AArch32 state, to be executed.
  3. The equivalent of the instruction `STR W1,[X0],#4`, if in AArch64 state, or `STR R1,[R0],#4`, if in AArch32 state, to be executed.
  4. EDSCR.{RXfull, ITE} to be set to {0,1}, and X1 or R1 to be set to an UNKNOWN value.

- **External reads from DBGDTRRX_EL0 return the last value written to DTRRX.**
- **External writes to EDITR generate an overrun error.**

During these accesses, EDSCR.{TXfull, RXfull, ITE} are used for flow control.

The architecture does not require precisely when these flags are set or cleared by the sequence of operations outlined in this section. For example, in the case of an external write to DBGDTRRX_EL0, in AArch64 state, RXfull might be cleared after step 2, or it might not be cleared until after step 3, as an implementation is free to fuse these steps into a single operation. The architecture does require that the flags are set as at step 4 when the PE is ready to accept a further read or write without causing an overrun error or an underrun error.

The process outlined in this section represents a simple sequential execution model of Memory access mode. An implementation is free to pipeline, buffer, and re-order instructions and transactions, as long as the following remain true:

- Data items are transferred into and out of the DTR in order and without loss of data, other than as a result of an overrun or an underrun.
- Data Aborts occur in order.
- The constraints of the memory type are met.

- In the list describing **External reads from DBGDTRTX_EL0:**
  — The MSR equivalent operation at step 3 of the sequence reads the value loaded by step 2.
  — If the list is performed in a loop, for all but the first iteration of this list, the value read by step 1 returns the values written by the MSR equivalent operation at the previous iteration of step 3.

- In the list describing **External writes to DBGDTRRX_EL0:**
  — The MSR equivalent operation at step 2 of the sequence returns the value written at step 1.
  — The STR equivalent at step 3 of the sequence writes the value read at step 2.

- If the PE cannot accept a read or write, as applicable, during the sequence, then the flags are updated to indicate an overrun or underrun.
See *Flow control of the DCC and ITR registers on page H4-5049* for more information on overrun and underrun.

**Ordering, access sizes and effect on exclusive monitors**

For the purposes of memory ordering, access sizes, and effect on the exclusive monitor, accesses in Memory access mode are consistent with Load/Store word instructions executed by the PE.

**Data aborts**

If the memory access generates a Data Abort, then:

- The Data Abort exception is taken. See *Exceptions in Debug state on page H2-5007*. In particular, EDSCR.ERR is set to 1. See *Cumulative error flag on page H4-5051*.
- Register R0 retains the address that generated the abort.
- Register R1 is set to an UNKNOWN value.
- EDSCR.TXfull, for a load, or EDSCR.RXfull, for a store, is set to an UNKNOWN value.
- DTRTX, for a load, or DTRRX, for a store, is set to an UNKNOWN value.
- EDSCR.ITE is set to 1.

**Illegal Execution State exception**

If PSTATE.IL is set to 1 when EDSCR.MA == 1, then on an external write access to DBGDTRRX_EL0 or an external read from DBGDTRTX_EL0, it is CONSTRAINED UNPREDICTABLE whether the PE:

- Takes an Illegal Execution State exception without performing any operations. In this case:
  - EDSCR.ERR is set to 1, see *Cumulative error flag on page H4-5051*.
  - Register R0 is unchanged.
  - Register R1 is set to an UNKNOWN value.
  - EDSCR.TXfull or EDSCR.RXfull, as applicable, is set to an UNKNOWN value.
  - DTRTX or DTRRX, as applicable, is set an UNKNOWN value.
  - EDSCR.ITE is set to 1.
  
  See also *Exceptions in Debug state on page H2-5007*.
- Ignores PSTATE.IL.

**Note**

The typical usage model for Memory access mode involves executing instructions in Normal access mode to set up X0 before setting EDSCR.MA to 1. These instructions generate an Illegal state exception if PSTATE.IL is set to 1.

**Alignment constraints**

If the address in R0 is not aligned to a multiple of four, the behavior is as follows:

- For each external DTR access a CONSTRAINED UNPREDICTABLE choice of:
  1. The PE makes an unaligned memory access to R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
  2. The PE makes a memory access to Align(X[0],4) in AArch64 state, or Align(R[0],4) in AArch32 state.
  3. The PE generates an Alignment fault, regardless of whether alignment checking is enabled.
  4. The PE does nothing.
- Following each memory access, if there is no Data Abort, R0 is updated with an UNKNOWN value.
- For external writes to DBGDTRRX_EL0, if the PE writes to memory, an UNKNOWN value is written.
H4 The Debug Communication Channel and Instruction Transfer Register
H4.3 DCC and ITR access modes

- For external reads of DBGDTRTX_EL0 an UNKNOWN value is returned.
- The RXfull and TXfull flags are left in an UNKNOWN state, meaning that a DBGDTRTX_EL0 read can trigger a TX underrun, and a DBGDTRTX_EL0 write can trigger an RX overrun.

H4.3.3 Memory-mapped accesses to the DCC and ITR

Writes to the flags in EDSCR by external debug interface accesses to the DCC and the ITR registers are indirect writes, because they are a side-effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see Register access permissions for memory-mapped accesses on page H8-5106.
H4.4 Flow control of the DCC and ITR registers

This sub-section describes the flow-control of the DCC and ITR registers:

- Ready flags.
- Buffering writes to EDITR.
- Overrun and underrun flags on page H4-5050.
- Cumulative error flag on page H4-5051.

H4.4.1 Ready flags

In Normal access mode:

- For the DTR registers there are two ready flags:
  - EDSCR.RXfull == 1 indicates that DBGDTRRX_EL0 contains a valid value that has been written by the external debugger and not yet read by software running on the target.
  - EDSCR.TXfull == 1 indicates that DBGDTRTX_EL0 contains a valid value that has been written by software running on the target and not yet read by an external debugger.

- For the ITR register there is a single ready flag:
  - EDSCR.ITE == 1 indicates that the PE is ready to accept an instruction to the ITR.

Note

The architecture permits a PE to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, as long as those instructions are discarded if EDSCR.ERR is set, either by an underrun or overrun or by any of the other error conditions described in this architecture, such as an instruction generating an abort.

In Memory access mode:

- EDSCR.{RXfull, ITE} == {0,1} indicates that DBGDTRRX_EL0 is empty and the PE is ready to accept a word external write to DBGDTRRX_EL0.
- EDSCR.{TXfull, ITE} == {1,1} indicates that DBGDTRTX_EL0 is full and the PE is ready to accept a word external read from DBGDTRTX_EL0.

All other values indicate that the PE is not ready, and result in a DTR overrun or underrun error, an ITR overrun error, or both, as defined in Overrun and underrun flags on page H4-5050.

EDSCR.{ITE, RXfull, TXfull} shows the status of the ITR and DCC registers. It ignores the question of whether a read or write cannot be accepted because, for example, EDSCR.ERR is set or the software lock is locked for memory-mapped accesses (EDLSR.SLK == 1).

H4.4.2 Buffering writes to EDITR

The architecture permits a processor to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, provided that:

- Those instructions are discarded if EDSCR.ERR is set to 1, either by an underrun or an overrun, or by any other error conditions described in this architecture, such as an instruction generating an abort.

- The PE maintains the simple sequential execution model with the order of instructions determined by the order in which the PE accepts the EDITR writes. In particular, the buffered instructions must be executed in the execution state consistent with a simple sequential execution of the instructions, even if one of the previous instructions is a state changing operation, such as DCPS or DRPS.
H4.4.3 Overrun and underrun flags

Each of the ready flags has a corresponding overrun or a corresponding underrun flag. These are sticky status flags that are set if the register is accessed using the external debug interface when the corresponding ready flag is not in the ready state.

If the PE is in Debug state and Memory access mode, the corresponding error flag is also set if the PE is not ready to accept an operation because a previous load or store is still in progress. The sticky status flag remains set until cleared by writing 1 to EDRCR.CSE.

Note
The architecture permits a PE to continue to accept and buffer data to write to memory in Memory access mode.

Table H4-1 shows DCC and ITR ready flags and the overrun and underrun flags associated with them.

<table>
<thead>
<tr>
<th>External debug interface access</th>
<th>Overrun/Underrun condition</th>
<th>EDSCR flag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write DBGDTRRX_EL0</td>
<td>EDSCR.RXfull == '1'</td>
<td></td>
</tr>
<tr>
<td>Read DBGDTRTX_EL0</td>
<td>EDSCR.TXfull == '0'</td>
<td></td>
</tr>
<tr>
<td>Write EDITR</td>
<td>Halted() &amp;&amp; (EDSCR.ITE == '0'</td>
<td></td>
</tr>
</tbody>
</table>

When an overrun or underrun flag is set to 1, the cumulative error flag, EDSCR.ERR, described in Cumulative error flag on page H4-5051, is also set to 1.

In the event of an external write to DBGDTRRX_EL0 or EDITR generating an overrun, or an external read from DBGDTRTX_EL0 generating an underrun:
- For a write, the written value is ignored.
- For a read, an UNKNOWN value is returned.
- EDSCR.TXfull, EDSCR.RXfull or EDSCR.ITE, as applicable, are not updated.

There is no overrun or underrun detection on external reads of DBGDTRRX_EL0 or external writes of DBGDTRTX_EL0.

There is no overrun or underrun detection of direct reads and direct writes of the DTR system registers by software:
- If RXfull == 0, a direct read of DBGDTRRX or DBGDTR_EL0 returns UNKNOWN.
- If TXfull == 1, a direct write of:
  - DBGDTRTX sets DTRTX to UNKNOWN.
  - DBGDTR_EL0 sets DTRRX and DTRTX to UNKNOWN.

See DCC accesses in Non-debug state on page H4-5054 for more information.

Accessing 64-bit data

In AArch64 state, a software access to the DBGDTR_EL0 register and an external debugger access to both DBGDTRRX_EL0 and DBGDTRTX_EL0 can perform a 64-bit half-duplex operation.

However, there is only overrun and underrun detection on one of the external debug registers. That is:
- If software directly writes a 64-bit value to DBGDTR_EL0, only TXfull is set to 1, meaning:
  - A subsequent external write to DBGDTRRX_EL0 would not be detected as an overrun.
  - If the external debugger reads DBGDTRTX_EL0 first, software might observe MDCCSR_EL0.TXfull == 0 and send a second value before the external debugger reads DBGDTRRX_EL0, leading to an undetected overrun.
On external writes to both DBGDTRRX_EL0 and DBGDTRTX_EL0 only RXfull is set to 1, meaning:
- A subsequent direct write of DBGDTRTX_EL0 would not be detected as an overrun.
- If the external debugger writes to DBGDTRRX_EL0 first, software might observe MDCCSR_EL0.RXfull == 1 and read a full 64-bit value, before the external debugger writes to DBGDTRTX_EL0, leading to an undetected underrun.

To avoid this, debuggers need to be aware of the data size used by software for transfers and ensure that 64-bit data is read or written in the correct order. If the PE is in Non-debug state, this order is as follows:

- The external debugger must check EDSCR.{RXfull, TXfull} before each transfer.
- To receive a 64-bit value from the target, the external debugger must read DBGDTRRX_EL0 before reading DBGDTRTX_EL0.
- To send a 64-bit value to the target, the external debugger must write to DBGDTRTX_EL0 before writing DBGDTRRX_EL0.

Because three accesses are required to transfer 64 bits of data, 64-bit transfers are not recommended for regular communication between host and target. The use of underrun and overrun detection means that only one access is required for 32 bits of data when using 32-bit transfers.

In Debug state, the debugger controls the instructions executed by the PE, so these limitations do not apply. 64-bit transfers provide a means to transfer a 64-bit general register between the host and the target in Debug state.

### Cumulative error flag

The cumulative error flag, EDSCR.ERR, is set to 1:
- On taking an exception from Debug state.
- On any signaled overrun or underrun in the DCC or ITR.

When EDSCR.ERR == 1:
- External reads of DBGDTRTX_EL0 do not have any side-effects.
- External writes to DBGDTRRX_EL0 are ignored.
- External writes to EDITR are ignored.
- No further instructions can be issued in Debug state. This includes any instructions previously accepted as external writes to EDITR that occur in program order after the instruction or access that caused the error.

This allows a debugger to stream data, or, in Debug state, instructions, to the target without having to:

- Check EDSCR.{RXfull, TXfull, ITE} before each access.
- Check EDSCR.{ITO, RXO, TXU} following each access, for overrun or underrun.
- Check PSTATE or other syndrome registers, or both, for an exception following each instruction executed in Debug state that might generate a synchronous exception.

The cumulative error flag remains set until cleared by writing 1 to EDRCR.CSE. See EDRCR, External Debug Reserve Control Register on page H9-5193.

For overruns and underruns, EDSCR.{ITO, RXO, TXU} record the error type.

### Pseudocode description of clearing the error flag

The pseudocode for the ClearStickyError() function is as follows:

```plaintext
// ClearStickyErrors()
// ===================
ClearStickyErrors()
EDSCR.TXU = '0';  // Clear TX underrun flag
```
EDSCR.RXO = '0';            // Clear RX overrun flag
if Halted() then            // in Debug state
    EDSGR.ITO = '0';        // Clear ITR overrun flag
EDSCR.ERR = '0';            // Clear cumulative error flag
return;
H4.5 Synchronization of DCC and ITR accesses

In addition to the standard synchronization requirements for register accesses, the following subsections describe additional requirements that apply for the DCC and ITR registers:

- Summary of system register accesses to the DCC.
- DCC accesses in Non-debug state on page H4-5054.

In these sections, accesses by the external debug interface are referred to as external reads and external writes. Accesses to system registers are referred to as direct reads, direct writes, indirect reads, and indirect writes.

--- Note ---

In Synchronization requirements for System registers on page D7-1902 external reads and external writes are described as forms of indirect access. This whole section uses more explicit terminology.

The DTR registers and the DCC flags, TXfull and RXfull, form a communication channel, with one end operating asynchronously to the other. Implementations must respect the ordering of accesses to these registers in order to maintain the correct behavior of the channel.

External reads of, and external writes to DBGDTRRX_EL0 and DBGDTRTX_EL0 are asynchronous to direct reads of, and direct writes to, DBGDTRRX, DBGDTRTX, and in AArch64 state DBGDTR_EL0, made by software using system register access instructions. The direct reads and direct writes indirectly write to the DCC flags. The external reads and external writes indirectly read the DCC flags to check for underrun and overrun.

Throughout this section:

**DCC flags**

Means any or all of the following:

- The EDSCR.RXfull.TXfull ready flags.
- The EDSCR.RXO overrun flag.
- The EDSCR.TXU underrun flag.
- The EDSCR.ERR cumulative error flag.

**ITR flags**

Means any or all of the following:

- The EDSCR.ITE ready flag.
- The EDSCR.ITO overrun flag.
- The EDSCR.ERR cumulative error flag.

H4.5.1 Summary of system register accesses to the DCC

System register accesses to the DTR registers are direct reads and writes of those registers, as shown in Table H4-2 on page H4-5054. Several of these instructions access the same registers using different encodings.

With the exception of the read and write bits, DBGDTRRX and DBGDTRTX are the same encoding, with exception of the read/write bits, but use different registers. The ARMv8 architecture governs the order of these instructions, as described in Synchronization requirements for System registers on page D7-1902. For more details, see the description of the individual register in the relevant chapter, Chapter D7 AArch64 System Register Descriptions or Chapter G6 AArch32 System Register Descriptions.

Table H4-2 on page H4-5054 shows a summary of system register accesses to the DCC.
H4.5 Synchronization of DCC and ITR accesses

H4.5.2 DCC accesses in Non-debug state

In Non-debug state DCC accesses are as described in Normal access mode on page H4-5045:

- If a direct read of DCCSR returns RXfull == 1, then a following direct read of DBGDTRRX, or in AArch64 state of DBGDTR_EL0, returns valid data and indirectly writes 0 to DCCSR.RXfull as a side-effect.

- If a direct read of DCCSR returns TXfull == 0, then a following direct write to DBGDTRTX, or in AArch64 state to DBGDTR_EL0, writes the intended value, and indirectly writes 1 to DCCSR.TXfull as a side-effect.

No context synchronization operation is required between these two instructions. Overrun and underrun detection prevents intervening external reads and external writes affecting the outcome of the second instruction.

The indirect write to the DCC flags as part of the DTR access instruction is made atomically with the DTR access.

Because a direct read of DBGDTRRX is an indirect write to DCCSR.RXfull, it must occur in program order with respect to the direct read of DCCSR, meaning it must not return a speculative value for DTRRX that predates the RXfull flag returned by the read of DCCSR. The direct write to DBGDTRTX must not be executed speculatively.

Direct reads of DBGDTRRX, or in AArch64 state DBGDTR_EL0, and DCCSR, must occur in program order with respect to other direct reads of the same register using the same encoding.

The following accesses have an implied order within the atomic access:

- In the simple sequential execution of the program the indirect write of the DCC flags occurs immediately after the direct DTR access.

<table>

</tr>
</tbody>
</table>

Note

For an access to DBGDTR_EL0, this means the indirect write happens after both DBGDTRRX_EL0 and DBGDTRTX_EL0 have been accessed.
• In the simple sequential execution model, for an external read of DBGDTRTX_EL0 or an external write of DBGDTRRX_EL0:
  — The check of the DCC flags for overrun or underrun occurs immediately before the access.
  — If there is no underrun or overrun, the update of the DCC flags occurs immediately after the access.
  — If there is underrun or overrun, the update of the DCC underrun or overrun flags occurs immediately after the access.

All observers must observe the same order for accesses.

--- Note ---
These requirements do not create order where order does not otherwise exist. It applies only for ordered accesses.

---

Without explicit synchronization following external writes and external reads:

• The value written by the external write to DBGDTRRX_EL0 that does not overrun, must be observable to direct reads of DBGDTRRX and DBGDTR_EL0 in finite time.

• The DCC flags that are updated as a side-effect of the external write or external read must be observable:
  — To subsequent external reads of EDSCR.
  — To subsequent external reads of DBGDTRRX_EL0 when checking for underrun.
  — To subsequent external writes to DBGDTRTX_EL0 when checking for overrun.
  — To direct reads of DCCSR in finite time.

However, explicit synchronization is required to guarantee that a direct read of DCCSR returns up-to-date DCC flags. This means that if a signal is received from another agent that indicates that DCCSR must be read, an ISB is required to ensure that the direct read of DCCSR occurs after the signal has been received. This also synchronizes the value in DBGDTRRX, if applicable. However, if that signal is an interrupt exception triggered by COMMIRQ, COMMTX, or COMMRX, the exception entry is sufficient synchronization. See Synchronization of DCC interrupt request signals on page H4-5057.

Explicit synchronization is required following a direct read or direct write:

• To ensure that a value directly written to DBGDTRTX is observable to external reads of DBGDTRTX_EL0.

• To ensure that a value directly written to DBGDTR_EL0 is observable to external reads of DBGDTRTX_EL0 and DBGDTRRX_EL0.

• To guarantee that the indirect writes to the DCC flags that were a side-effect of the direct read or direct write have occurred, and therefore that the updated values are:
  — Observable to external reads of EDSCR.
  — Observable to external reads of DBGDTRRX_EL0 when checking for underrun.
  — Observable to external writes of DBGDTRTX_EL0 when checking for overrun.
  — Returned by a following direct read of DCCSR.

See also Memory-mapped accesses to the DCC and ITR on page H4-5048 and Synchronization of changes to the external debug registers on page H8-5102.

--- Note ---
These ordering rules mean that software:

• Must not read DBGDTRRX without first checking DCCSR.RXfull or if the previously-read value of DCCSR.RXfull is 0.
  It is not sufficient to read both registers and then later decide whether to discard the read value, as there might be an intervening write from the external debug interface.

• Must not write DBGDTRTX without first checking DCCSR.TXfull or if the previously-read value of DCCSR.TXfull is 1.
The write to DBGDTRX overwrites the value in DTRTX, and the external debugger might or might not have read this value.

- Must ensure there is an explicit context synchronization operation following a DTR access, even if not immediately returning to read DCCSR again. This synchronization operation can be an exception return.

**Derived requirements**

The rules for DCC accesses in Non-debug state are as follows:

- Following a direct read of DBGDTRRX when RXfull is 1:
  - If an external write to DBGDTRRX checks the RXfull flag for overrun and observes that the value of RXfull is 0, the value returned by the previous direct read must not be affected by the external write.
  - If an external read of EDSCR returns a RXfull value of 0, then the value returned by the previous direct read must not be affected by a following external write to DBGDTRX, and the following external write does not overflow.

- Following a direct read of DBGDTR_EL0, when RXfull is 1:
  - If an external write to DBGDTRRX checks the RXfull flag for overrun and observes that the value of RXfull is 0, the value returned by the previous direct read must not be affected by the external write nor by a following direct write to DBGDTRRX.
  - If an external read of EDSCR returns a RXfull value of 0, then the value returned by the previous direct read must not be affected by subsequent external writes to DBGDTRRX and DBGDTRTX in any order, and the following external write of DBGDTRRX will not overflow.

- Following a direct write to DBGDTRTX, when TXfull is 0:
  - If an external read of DBGDTRTX checks the TXfull flag for underrun and observes that the value of TXfull is 1, the value returned by the external read must be the value written by the previous direct write.
  - If an external read of EDSCR returns a TXfull value of 1, then the value returned by a following external read of DBGDTRRX must be the value written by the previous direct read, and the subsequent external read will not underrun.

- Following a direct write to DBGDTR_EL0, when TXfull is 0:
  - If an external read of DBGDTRTX checks the TXfull flag for underrun and observes that the value of TXfull is 1, the values returned by the external read and by a subsequent external read of DBGDTRRX must be the value written by the previous direct write.
  - If an external read of EDSCR returns a TXfull value of 1, then the value returned by subsequent external reads of DBGDTRRX and DBGDTRTX, in any order, must be the value written by the previous direct read, and the subsequent external read of DBGDTRTX does not underrun.

- Following an external read of DBGDTRTX that does not underrun, if a direct read of DCCSR returns a TXfull value of 0, then the value returned by the external read must not be affected by a following direct write to DBGDTRRX.

- Following a first external read DBGDTRRX and a following second external read of DBGDTRTX that does not underrun, if a direct read of DCCSR returns a TXfull value of 0, then the values returned by the external reads must not be affected by a following direct write to DBGDTR_EL0.

- Following an external write to DBGDTRRX that does not overrun, if a direct read of DCCSR returns an RXfull value of 1, then the value returned by a following direct read of DBGDTRRX or DBGDTR_EL0 must be the value written by the previous external write.

- Following a first external write to DBGDTRTX and a following second external write to DBGDTRRX that does not overrun, if a direct read of DCCSR returns an RXfull value of 1, then the value returned by a subsequent direct read of DBGDTR_EL0 must return the values written by the previous external writes.
Synchronization of DCC interrupt request signals

Following an external read or external write access to the DTR registers, the interrupt request signals, COMMIRQ, COMMTX, and COMMRX, must be updated in finite time without explicit synchronization.

The updated values must be observable to a direct read of DCCSR or DBGDTRRX, or a direct write of DBGDTRTX executed after taking an interrupt exception generated by the interrupt request. The updated values must also be observable to a direct write of DBGDTRTX executed after taking an interrupt exception generated by the interrupt request.

Following a direct read of DBGDTRRX or a direct write to DBGDTRRX, software must execute a context synchronization operation to guarantee the interrupt request signals have been updated in finite time. This synchronization operation can be an exception return.

DCC and ITR access in Debug state

In Normal access mode, without explicit synchronization:

- A direct read or direct write of the DTR registers by an instruction written to EDITR must be observable to an external write or an external read in finite time:
  - A direct read of DBGDTRRX must be observable to an external write of DBGDTRRX_EL0.
  - A direct read of DBGDTR_EL0 must be observable to an external write of DBGDTRRX_EL0 and DBGDTRTX_EL0.
  - A direct write of DBGDTRTX must be observable to an external read of DBGDTRTX_EL0.
  - A direct write of DBGDTR_EL0 must be observable to an external read of DBGDTRRX_EL0 and DBGDTRTX_EL0.

This includes the indirect write to the DCC flags that occurs atomically with the access as described in DCC accesses in Non-debug state on page H4-5054.

The subsequent external write or external read must observe either the old or the new values of both the DTR contents and DCC flags. If the old values are observed, this typically results in overrun or underrun, assuming the old values of the DCC flags indicate an overrun or underrun condition, as would normally be the case. This means the debugger can observe the direct read or direct write without explicit synchronization and without explicitly testing the DCC flags in EDSCR, because it can rely on overrun and underrun tests.

- External reads of DBGDTRTX_EL0 that do not underrun and external writes to DBGDTRRX_EL0 that do not overrun must be observable to an instruction subsequently written to EDITR on completion of the first external access. This includes the indirect write to the DCC flags.

This means that without explicit synchronization and without the need to first check the DCC flags in DCCSR:

- If the instruction is a direct read of DBGDTRRX, it observes the external write.
- If the instruction is a direct write of DBGDTRTX, it observes the external read.

- Writes to EDITR that do not overrun commit an instruction for execution immediately. The instruction must complete execution in finite time without requiring any further operation by the debugger.

- After an external write to the EDITR, the ITR flags that are updated as a side effect of that write must be observable by:
  - An external read of the EDSCR that follows the external write to the EDITR.
  - When checking for overrun, another external write to the EDITR that follows the original external write to the EDITR.

In Memory access mode, these requirements shift to the instructions implicitly executed by external reads and external writes of the DTR registers, as described in Memory access mode on page H4-5046.
H4.6 Interrupt-driven use of the DCC

ARM recommends implementations provide a level-sensitive DCC interrupt request through the IMPLEMENTATION DEFINED interrupt controller as a private peripheral interrupt for the originating PE.

--- Note ---

- In addition to connection to the interrupt controller ARM also recommends COMMIRQ, COMMTX, and COMMRX signals that might be implemented for use by any legacy system peripherals.
- GICv3 reserves a private peripheral interrupt number for the COMMIRQ interrupt.

The DCCINT register provides a first level of interrupt masking within the PE, meaning only a single interrupt source, COMMIRQ, is needed at the interrupt controller.

See also Synchronization of DCC interrupt request signals on page H4-5057.
H4.7 Pseudocode description of the operation of the DCC and ITR registers

The basic operation of the DCC and ITR registers is shown by the following pseudocode functions. These functions do not cover the behavior when OSLSR.OSLK == 1, meaning that the OS lock is locked.

The definition of the DTR Registers is:

bits(32) DTRRX;
bits(32) DTRTX;

The pseudocode for the DBGDTR_EL0() function is as follows:

```c
// DBGDTR_EL0[] (write)
// ====================
// System register writes to DBGDTR_EL0, DBGDTRTX_EL0 (AArch64) and DBGDTRTXint (AArch32)

DBGDTR_EL0[] = bits(N) value

// For MSR DBGDTRTX_EL0,<Rt>  N=32, value=X[t]<31:0>, X[t]<63:32> is ignored
// For MSR DBGDTR_EL0,<Xt>    N=64, value=X[t]<63:0>
assert N IN {32,64};
if EDSCR.TXfull == '1' then
    value = bits(N) UNKNOWN;

    // SetInterruptRequestLevel(InterruptID_CMOMTX, if commtx then HIGH else LOW);
    // The value to be driven onto the common COMMIRQ signal.
    commirq = ((commrx && MDCCINT_EL1.RX == '1') ||
               (commtx && MDCCINT_EL1.TX == '1'));
    SetInterruptRequestLevel(InterruptID_COMMIRQ, if commirq then HIGH else LOW);

return;
```
Chapter H5
The Embedded Cross Trigger Interface

This chapter describes the embedded cross-trigger interface. It contains the following sections:

- About the Embedded Cross Trigger (ECT) on page H5-5064.
- Basic operation on the ECT on page H5-5066.
- Cross-triggers on a PE in an ARMv8 implementation on page H5-5070.
- Description and allocation of CTI triggers on page H5-5071.
- CTI registers programmers’ model on page H5-5075.
- Examples on page H5-5076.
H5.1 About the Embedded Cross Trigger (ECT)

The Embedded Cross Trigger, ECT, allows a debugger to:

- Send trigger events to a PE. For example, this might be done to halt the PE.
- Send a trigger event to one or more PEs when a trigger event occurs on another PE. For example, this might be done to halt all PEs when one individual PE halts.

Figure H5-1 shows the logical structure of an ECT.

![Figure H5-1 Structure of an embedded cross trigger](image)

The ECT can deliver many types of trigger events, which are described in the following sections:

- Debug request trigger event on page H5-5072.
- Restart request trigger event on page H5-5072.
- Cross-halt trigger event on page H5-5072.
- Performance Monitors overflow trigger event on page H5-5073.
- Generic trace external input trigger events on page H5-5073.
- Generic trace external output trigger events on page H5-5073.
- Generic CTI interrupt trigger event on page H5-5073.

An ARMv8-A implementation must:

- Include a cross-trigger interface, CTI.
- Implement at least the input and output triggers defined in this architecture.

See Cross-triggers on a PE in an ARMv8 implementation on page H5-5070.

In addition, ARM recommends that the cross-trigger includes:

- The ability to route trigger events between Trace extensions:
  - These typically have advanced event triggering logic.
- An output trigger to the interrupt controller.

--- Note ---

The ECT and CTI must only signal trigger events for external debugging. They must not route software events, such as interrupts. For example, the Performance Monitors overflow input trigger is provided to allow entry to Debug state on a counter overflow, and the output trigger to the interrupt controller is provided to generally allow events from the external debug sub-system to be routed to a software agent. However, the combination of the two must not be used as a mechanism to route Performance Monitors overflows to an interrupt controller.
H5.1.1 Implementation with a CoreSight CTI

For details of the recommended connections in an ARMv8-A implementation, see Appendix J2 Recommended External Debug Interface. See also CoreSight™ SoC Technical Reference Manual.
H5.2 Basic operation on the ECT

The ECT comprises a Cross-Trigger Matrix, CTM, and one Cross-Trigger Interface, CTI, for each PE. The CTM passes events between the CTI blocks over channels. The CTM can have a maximum of 32 channels.

The main interfaces of the cross-trigger interface, CTI, are:

- The input triggers:
  - These are trigger event inputs from the PE to the CTI.
- The output triggers:
  - These are trigger event outputs from the CTI to the PE.
- The input channels:
  - These are channel event inputs from the cross-trigger matrix, CTM, to the CTI.
- The output channels:
  - These are channel event outputs from the CTI to the CTM.

Each CTI block has:

- Up to 32 input triggers that come from the PE:
  - The input triggers are numbered 0-31.
- Up to 32 output triggers that go to the PE:
  - The output triggers are numbered 0-31.

Figure H5-2 on page H5-5067 shows the logical internal structure of a CTI.
Figure H5-2 Structure of a cross-trigger interface

--- Note ---

- The number of triggers is IMPLEMENTATION DEFINED. Figure H5-2 shows eight input and eight output triggers.
- The number of channels is IMPLEMENTATION DEFINED. Figure H5-2 shows four channels.
- In Figure H5-2 the input channel gate function is a CTIv2 feature.

When the CTI receives an input trigger event, this generates channel events on one or more internal channels, according to the mapping function defined by the Input trigger→output channel mapping registers, CTIINEN<n>. The CTI also contains an application trigger and channel pulse to allow a debugger to create channel events directly on internal channels by writing to the CTI control registers.
Channel events on each internal channel are passed to a corresponding output channel that is controlled by a *channel gate*. The channel gate can block propagation of channel events from an internal channel to an output channel.

The output channels from a CTI are combined, using a logical OR function, with the output channels from all other CTIs to form the input channels on other CTIs. The input channels of this CTI are the logical OR of the output channels on all other CTIs. This is the *cross-trigger matrix*, CTM. Therefore, the number of input channels must equal the number of output channels.

--- Note ---
The number of input triggers and output triggers is not required to be the same.

---

The internal channels form an internal cross-trigger matrix within the CTI. This delivers events directly from the input triggers to the output triggers. Therefore the number of internal channels is the same as the number of input and output channels on the external CTM, and there is a direct mapping between the two.

Channel events received on each input channel are passed to the corresponding internal channel. It is IMPLEMENTATION DEFINED whether the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

When the CTI receives a channel event on an internal channel this generates trigger events on one or more output triggers, according to the mapping function defined by the *Input channel → output trigger mapping registers*, `CTIOUTEN<n>`.

The CTI contains the input and output trigger interfaces to the PE and the interface of the cross-trigger matrix. The architecture does not define the signal protocol used on the trigger interfaces, and:

- It is IMPLEMENTATION DEFINED whether the CTI supports multicycle input trigger events.
- It is IMPLEMENTATION DEFINED whether the CTM supports multicycle channel events.

See *Multicycle events*.

However, an output trigger is asserted until acknowledged. The output trigger can be:

- Self-acknowledging. This means that no further action is required from the debugger.
- Acknowledged by the debugger writing 1 to the corresponding bit of `CTIINTACK`.

The time taken to propagate a trigger event from the first PE, through its CTI, across the CTM to another CTI, and thereby to a second PE is IMPLEMENTATION DEFINED.

--- Note ---
ARM recommends that this path is not longer than the shortest software communication path between those PEs. This is because if the first PE halts, the Cross-halt trigger event can propagate through the ECT and halt the second PE without causing software on the second PE to malfunction because the first PE is in Debug state and is not responding.

---

### H5.2.1 Multicycle events

A multicycle event is one with a continuous state that might persist over many cycles, as opposed to a discrete event. A typical implementation of a multicycle event is a level-based signal interface, whereas a discrete event might be implemented as a pulse signal or message.

CTI support for multicycle trigger events is IMPLEMENTATION DEFINED. Use of multicycle trigger events is deprecated. Of the architecturally defined input trigger events, the Performance Monitors overflow trigger event and Generic trace external output trigger events can be multicycle input triggers.

CTM support for multicycle channel events is IMPLEMENTATION DEFINED. A CTM that does not support multicycle channel events cannot propagate a multicycle trigger event between CTIs.

--- Note ---
A full ECT might comprise a mix of CTIs, some of which can support multicycle trigger events. In bridging these components, multicycle channel events become single channel events at the boundary between the CTIs.
An ECT that supports multicycle trigger events

When an ECT supports multicycle trigger events, an input trigger event to the CTI continuously asserts channel events on all output channels mapped to it until either:
- The input trigger event is removed.
- The channel mapping function is disabled.

This means that an input trigger that is asserted for multiple cycles causes any channels that are mapped to it to become active for multiple cycles. Consequently, any output triggers mapped from that channel are asserted for multiple cycles.

Note
The output trigger remains asserted for at least as long as the channel remains active. This means that even if the output trigger is acknowledged, it remains asserted until the channel deactivates.

The CTI does not guarantee that these events have precisely the same duration, as the triggers and channels can cross between clock domains.

CTIAPPSET and CTIAPPCLEAR can set a channel active for multiple cycles. CTIAPPULSE generates a single channel event. CTICHINSTATUS and CTICHOUTSTATUS can report whether a channel is active.

An ECT that does not support multicycle trigger events

When an ECT does not support multicycle trigger events, an input trigger event to the CTI generates a single channel event on all output channels mapped to it, regardless of how long the input trigger event is asserted.

This means that an input trigger event that is asserted for multiple cycles generates a single channel event on any channels mapped to it. Consequently any self-acknowledging output triggers mapped from those channels are single trigger events.

Note
A single event is typically a single cycle, but there is no guarantee that this is always the case.

CTIAPPSET and CTIAPPCLEAR can only generate a single channel event. CTIAPPULSE generates a single channel event. If the ECT does not support multicycle channel events, use of CTIAPPSET and CTIAPPCLEAR is deprecated, and the debugger must only use CTIAPPULSE. CTICHINSTATUS and CTICHOUTSTATUS must be treated as UNKNOWN.
H5.3 Cross-triggers on a PE in an ARMv8 implementation

An ARMv8 PE must include a cross-trigger interface, and the implementation must include at least the input and output triggers defined in this architecture. The number of channels in the cross-trigger matrix is IMPLEMENTATION DEFINED, but there must be a minimum of three. Software can read CTIDEVID.NUMCHAN to discover the number of implemented channels.

The CTM must connect to all PEs in the same Inner Shareability domain as the ARMv8-A PE, but can also connect to additional PEs. ARM strongly recommends that the CTM connects all PEs implementing a CTI in the system. This includes ARMv7-A PEs and other PEs that can be connected using a CoreSight CTI module.

--- Note ---

In a uniprocessor system the CTM is OPTIONAL. The CTM might be connected other CTI modules for non-PEs, such as triggers for system visibility components. ARM recommends that the CTM is implemented.

Any CTI connected to a PE that is not an ARMv8-A PE must implement at least:

- The Debug request trigger event.
- The Restart trigger event.
- The Cross-halt trigger event.

For more information about the CTI, see the CoreSight™ SoC Technical Reference Manual. ARMv8-A refines the generic CTI by defining roles for each of the implemented input and output triggers.
H5.4 Description and allocation of CTI triggers

Table H5-1 shows the output trigger events defined by the architecture and the related trigger numbers.

<table>
<thead>
<tr>
<th>Number</th>
<th>Source</th>
<th>Destination</th>
<th>Event description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>4 - 7</td>
<td>Trace extension</td>
<td>CTI</td>
<td>OPTIONAL Generic trace external output trigger events on page H5-5073</td>
</tr>
</tbody>
</table>

--- Note ---
Input triggers to the CTI are outputs from other blocks.

Table H5-1 and Table H5-2 show the minimum set of trigger events defined by the architecture. However:

- The Generic trace external input and output trigger events are only required if the OPTIONAL Trace extension is implemented. If the OPTIONAL Trace extension is not implemented, these trigger events are reserved.

- Support for the generic CTI interrupt trigger event is IMPLEMENTATION DEFINED because details of interrupt handling in the system, including any interrupt controllers, are IMPLEMENTATION DEFINED. Details regarding how the CTI interrupt is connected to an interrupt controller and its allocated interrupt number lie outside the scope of the architecture. ARM strongly recommends that implementations provide a means to generate interrupts based on external debug events.

- The other trigger events are required by the architecture.

An ARMv8-A implementation can extend the CTI with additional triggers. These start with the number eight.
H5.4.1 Debug request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to force the PE into Debug state. The trigger event is asserted until acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to CTIINTACK[0].

--- Note ---

A debugger must poll CTITRIGOUTSTATUS[0] until it reads as 0, to confirm that the output trigger has been deasserted before generating any event that must be ordered after the write to CTIINTACK.

---

If the PE is already in Debug state, the PE ignores the trigger event, but the CTI continues to assert it until it is removed by the debugger. See also External Debug Request debug event on page H3-5034.

H5.4.2 Restart request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to request the PE to exit Debug state. If the PE is not in Debug state, the request is ignored and dropped by the CTI.

If a Restart request trigger event is received at or about the same time as the PE enters Debug state, it is constrained unpredictable whether:

- The restart is ignored. In this case the PE enters Debug state and remains in Debug state.
- The PE enters Debug state and then immediately restarts.

Debuggers must program the CTI to send Restart request trigger events only to PEs that are halted. To enable the PE to disambiguate discrete Restart request trigger events, after sending a Restart request trigger event, the debugger must confirm that the PE has restarted and halted before sending another Restart request trigger event. Debuggers can use EDPRSR.{SDR, HALTED} to determine the Execution state of the PE.

--- Note ---

Before generating a Restart request trigger event for a PE, a debugger must ensure any Debug request trigger event targeting that PE is cleared. Debug request trigger event describes how to do this.

---

The trigger event is self-acknowledging, meaning that the debugger requires no further action to remove the trigger event. See also Exiting Debug state on page H2-5014.

H5.4.3 Cross-halt trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted by a PE when it is entering Debug state.

--- Note ---

To reduce the latency of halting, ARM recommends that an implementation issues the Cross-halt trigger event early in the committed process of entering Debug state. This means that there is no requirement to wait until all aspects of entry to Debug state have completed before issuing the trigger event. Speculative emission of Cross-halt trigger events is not allowed. The Cross-halt trigger event must not be issued early enough for a subsequent Debug request trigger event, that might be derived from the Cross-halt trigger event, to be recorded in the EDSCR.STATUS field. This applies to Debug request trigger events that are acting as inputs to the PE.
**H5.4.4 Performance Monitors overflow trigger event**

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted each time the PE asserts a new Performance Monitors counter overflow interrupt request. See Chapter D5 The Performance Monitors Extension.

If the CTI supports multicycle trigger events, then the trigger event remains asserted until the overflow is cleared by a write to PMOVSCLR_EL0. Otherwise, the trigger event is not asserted again until the overflow is cleared by a write to PMOVSCLR_EL0.

--- Note ---

- This does not replace the recommended connection of Performance Monitors overflow trigger event to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI.
- Events can be counted when ExternalNoninvasiveDebugEnabled() == FALSE, and, in Secure state, when ExternalSecureNoninvasiveDebugEnabled() == FALSE. Secure software must be aware that overflow trigger events are nevertheless visible to the CTI.

---

**H5.4.5 Generic trace external input trigger events**

These are output trigger events from the CTI, and input trigger events to the OPTIONAL Trace extension, that are used in conjunction with the Generic trace external output trigger events to pass trigger events between:

- The PE and the OPTIONAL Trace extension.
- The OPTIONAL Trace extension and any other component attached to the CTM, including other Trace extensions.

There are four Generic trace external input trigger events.

The trigger events are self-acknowledging. This means that the debugger does not have to take any further action to remove the events.

---

**H5.4.6 Generic trace external output trigger events**

These are input trigger events to the CTI, and output trigger events from the OPTIONAL Trace extension, used in conjunction with the Generic trace external input trigger events to pass trigger events between:

- The PE and the OPTIONAL Trace extension.
- The OPTIONAL Trace extension and any other component attached to the CTM, including other Trace extensions.

There are four Generic trace external output trigger events.

---

**H5.4.7 Generic CTI interrupt trigger event**

This is an output trigger event from the CTI, and an input to an IMPLEMENTATION DEFINED interrupt controller, and can transfer trigger events from the PE, Trace extension, or any other component attached to the CTI and CTM to software as an interrupt. The Generic CTI interrupt trigger event must be connected to the interrupt controller as an interrupt that can target the originating PE.

--- Note ---

- ARM recommends that the Generic CTI interrupt trigger event is a private peripheral interrupt, but implementations might instead make this trigger event available as a shared peripheral interrupt or a local peripheral interrupt.
- GICv3 reserves a private peripheral interrupt number for this interrupt.
It is IMPLEMENTATION DEFINED whether this trigger event is:

- Self-acknowledging. This means that the debugger is not required to take any further action, and that the interrupt controller must treat the trigger event as a pulse or edge-sensitive interrupt.

- Acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to CTIINTACK[2]. This means that the interrupt controller must treat the trigger event as a level-sensitive interrupt.

ARM recommends that the Generic CTI interrupt trigger event is a self-acknowledging trigger event.
H5.5 CTI registers programmers’ model

The CTI registers programmers’ model is described in Chapter H8 About the External Debug Registers. The following sections contain information specific to the CTI:

• *External debug register resets* on page H8-5119.
• *External debug interface register access permissions* on page H8-5108.
• *Cross-trigger interface registers* on page H8-5117.
• The individual register descriptions in *Cross-Trigger Interface registers* on page H9-5206.

See also *Memory-mapped accesses to the external debug interface* on page H8-5106.

H5.5.1 CTI reset

An External Debug reset resets the CTI. See *External debug register resets* on page H8-5119 for details of CTI register resets. All CTI output triggers and output channels are deasserted on an External Debug reset.

H5.5.2 CTI authentication

The CTI ignores the state of the IMPLEMENTATION DEFINED authentication interface. This means that:

• *CTITRIGINSTATUS* shows the status of the input triggers and *CTICHINSTATUS* shows the status of the input channels, regardless of the value of *ExternalNoninvasiveDebugEnabled().*

  **Note**

  The PE does not generate the Cross-halt trigger event and the Trace extension does not generate Generic trace external output trigger events when *ExternalNoninvasiveDebugEnabled() == FALSE*. However, the PE can generate Performance Monitors overflow trigger events.

• The CTI can generate external triggers regardless of the value of *ExternalInvasiveDebugEnabled().*

  **Note**

  The PE ignores Debug request and Restart request trigger events when *ExternalInvasiveDebugEnabled() == FALSE*. The Trace extension ignores Generic trace external input trigger events when *ExternalNoninvasiveDebugEnabled() == FALSE*. The behavior of Generic CTI interrupt requests is part of the IMPLEMENTATION DEFINED handling of these interrupts, but it is permissible for an interrupt controller to receive these requests even when *ExternalInvasiveDebugEnabled() == FALSE.*
H5.6 Examples

The CTI is fully programmable and allows for flexible cross-triggering of events within a PE and between PEs in a multiprocessor system. For example:

- The Cross-halt trigger event and the Debug request trigger event can be used for cross-triggering in a multiprocessor system.
- The Cross-halt trigger event and the Generic interrupt trigger event can be used for event-driven debugging in a multiprocessor system.
- The Performance Monitors overflow trigger event and the Debug request trigger event can force entry to Debug state on overflow of a Performance Monitors event counter, for event-driven profiling.

Note

This does not replace the recommended connection of Performance Monitors overflow trigger events to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI. ARM recommends that the Performance Monitors overflow signal is directly available as a local interrupt source.

- The Generic trace external input and Generic trace external output trigger events can pass trace events into and out of the event logic of the Trace extension. They can do this:
  - To pass trace events between Trace extensions.
  - In conjunction with the Performance Monitors overflow trigger event, to couple the Performance Monitors to the Trace extension.
  - In conjunction with the Debug request trigger event, to trigger entry to Debug state on a trace event.
  - In conjunction with other CTIs, to signal a trace trigger event onto a CoreSight trace interconnect.

The following sections describe some examples in more detail:

- Halting a single PE.
- Halting all PEs in a group when any one PE halts on page H5-5077.
- Synchronously restarting a group of PEs on page H5-5077.
- Halting a single PE on Performance Monitors overflow on page H5-5078.

Example H5-1 Halting a single PE

To halt a single PE, set:

1. **CTIGATE[0]** to 0, so that the CTI does not pass channel events on internal channel 0 to the CTM.
2. **CTIOUTEN0[0]** to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 0.

Note

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instance of **CTIOUTEN<n>** for which <n> is 0.

3. **CTIAPPULSE[0]** to 1, to generate a channel event on channel 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to **CTIINTACK[0]**, before restarting the PE.
Example H5-2 Halting all PEs in a group when any one PE halts

To program a group of PEs so that when one PE in the group halts, all of the PEs in that group halt, set the following registers for each PE in the group:

1. CTIGATE[2] to 1, so that each CTI passes channel events on internal channel 2 to the CTM.
2. CTIINEN0[2] to 1, so that each CTI generates a channel event on channel 2 in response to a Cross-halt trigger event.
3. CTIOUTEN0[2] to 1, so that each CTI generates a Debug request trigger event in response to a channel event on channel 2.

——— Note ————
The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instances of CTIINEN<n> and CTIOUTEN<n> for which <n> is 0.

When a PE has halted, clear the Debug request trigger event by writing a value of 1 to CTIINTACK[0], before restarting the PE.

Example H5-3 Synchronously restarting a group of PEs

To restart a group of PEs, for each PE in the group:

1. If the PE was halted because of a Debug request trigger event, the debugger must ensure the trigger event is deasserted. It can do this by:
   a. Writing 1 to CTIINTACK[0] to clear the Debug request trigger event.
   b. Polling CTITRIGOUTSTATUS[0], until it reads as 0, to confirm that the trigger event has been deasserted.
2. Set CTIGATE[1] to 1, so that each CTI passes channel events on internal channel 1 to the CTM.
3. Set CTIOUTEN1[1] to 1, so that each CTI generates a Restart request trigger event in response to a channel event on channel 1.

——— Note ————
This example must use the instance of CTIOUTEN<n> for which <n> is 1.

4. Set CTIAPPPULSE[1] to 1 on any one PE in the group, to generate a channel event on channel 1.
Example H5-4 Halting a single PE on Performance Monitors overflow

To halt a single PE on a Performance Monitors overflow set:

1. \texttt{CTIGATE[3]} to 0, so that the CTI does not pass channel events on internal channel 3 to the CTM.

2. \texttt{CTIINEN1[3]} to 1, so that the CTI generates a channel event on channel 3 in response to a Performance Monitors overflow trigger event.

   \textbf{Note}  
   This step of this example must use the instance of \texttt{CTIINEN<n>} for which \(<n> = 1\).  

3. \texttt{CTIOUTEN0[3]} to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 3.

   \textbf{Note}  
   This step of this example must use the instance of \texttt{CTIOUTEN<n>} for which \(<n> = 0\).  

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to \texttt{CTIINTACK[0]}, before restarting the PE. Clear the overflow status by writing to \texttt{PMOVSCLR_EL0}. 

Chapter H6
Debug Reset and Powerdown Support

This chapter describes the reset and powerdown support in the Debug architecture. It contains the following sections:

- *About Debug over powerdown* on page H6-5080.
- *Power domains and debug* on page H6-5081.
- *Core power domain power states* on page H6-5082.
- *Emulating low-power states* on page H6-5084.
- *Debug OS Save and Restore sequences* on page H6-5086.
- *Reset and debug* on page H6-5091.

——— Note ————
Where necessary, *Table J11-1* on page J11-5816 disambiguates the general register references used in this chapter.
H6.1 About Debug over powerdown

Debug over powerdown is a facility for an operating system to save and restore the PE state on behalf of a self-hosted or external debugger or both.

For external debug over powerdown, the architecture defines the OS Lock, OS Double Lock, and the logical split of the hardware on which a PE executes into the **Core power domain** and the **Debug power domain**. See:

- *Power domains and debug* on page H6-5081.
- *Core power domain power states* on page H6-5082.
The external debug component of ARMv8-A has two logical power domains, each with its own reset:

- The debug power domain contains the interface between the PE and the external debugger, and is powered up whenever an external debugger is connected to the SoC. It remains powered up while the external debugger is connected. Registers in this domain are reset by an external debug reset.
- The core power domain contains the rest of the PE, and is allowed to power up and power down independently of the Debug power domain.

The core power domain contains several types of registers:

- Non-debug logic refers to all registers and logic that are not associated with debug.
- Self-hosted debug logic refers to registers and logic associated solely with the self-hosted debug aspects of the architecture.
- Shared debug logic refers to registers and logic associated with both the self-hosted and external debug aspects of the architecture.
- External debug logic refers to registers and logic associated solely with the external debug aspects of the architecture.

**Note**

- The model of two logical power domains has an impact on the reset and access permission requirements of the debug programmers' model.
- The power domains are described as logical because the architecture defines the requirements but does not require two physical power domains. Any power domain split that meets the requirements of the programmers’ model is a valid implementation.

Figure H6-1 shows the recommended power domain split. The signals **DBGWRUPREQ**, **DBGNOPWRDWN**, and **DBGWRDUP** shown in Figure H6-1 provide an interface between the power controller and the PE debug logic that is in the debug power domain. They are part of the recommended interface. See Appendix J2 Recommended External Debug Interface.
H6.3 Core power domain power states

The ARM architecture does not define the power states of the PE as these are not normally visible to software. However, they are visible to the external debugger. The Debug architecture uses a four logical power states model for the core power domain. The four logical power states are as follows:

- **Normal**: The core power domain is fully powered up and the debug registers are accessible.

- **Standby**: The core power domain is on, but there are measures to reduce energy consumption. In a typical implementation, the PE enters standby by executing a WFI or WFE instruction, and exits on a wake-up event. There can be other IMPLEMENTATION DEFINED measures the OS can take to enter standby. The PE preserves the PE state, including the debug logic state. Changing from standby to normal operation does not involve a reset of the PE.

  Standby is the least invasive OS energy saving state. Standby implies only that the PE is unavailable and does not clear any debug settings. For standby, the Debug architecture requires only the following:
  
  - An External Debug Request debug event is a wake-up event when halting is allowed. This means that the PE must exit standby to handle the debug event. If the PE executed a WFE or a WFI instruction to enter standby, then it retires that instruction,
  
  - If the external debug interface is accessed, the PE must respond to that access. ARM recommends that, if the PE executed a WFI or WFE instruction to enter standby, then it does not retire that instruction.

  Standby is transparent, meaning that to software and to an external debugger it is indistinguishable from normal operation.

- **Retention**: The OS takes some measures, including IMPLEMENTATION DEFINED code sequences and registers, to reduce energy consumption. The PE state, including debug settings, is preserved in low-power structures, allowing the core power domain to be at least partially turned off.

  Changing from low-power retention to normal operation does not involve a reset of the PE. The saved PE state is restored on changing from low-power retention state to normal operation. If software has to use an IMPLEMENTATION DEFINED code sequence before entering, or after leaving, a retention state, this is referred to as a **software-visible retention state**. It is IMPLEMENTATION DEFINED whether the value of DBGPRCR.CORENPDRQ is set to the value of EDPRCR.COREPURQ on leaving the software-visible retention state.

  External Debug Request debug events stay pending and debug registers in the core power domain cannot be accessed.

  **Note**

  - This model of retention does not include implementations where the PE exits the state in response to a debug register access. From the Debug architecture perspective, implementations like this are forms of standby.

- **Powerdown**: The OS takes some measures to reduce energy consumption by turning the core power domain off. These measures must include the OS saving any PE state, including the debug settings, that must be preserved over powerdown. Changing from powerdown to normal operation must include:

  - A Cold reset of the PE after the power level has been restored.
  
  - The OS restoring the saved PE state.

  External Debug Request debug events stay pending and debug registers in the core power domain cannot be accessed.

  The Debug architecture uses a simpler two states model for the Debug power domain. The two states are:

  - **Off**: The debug power domain is turned off.
  
  - **On**: The debug power domain is turned on.
The available power states, including the cross-product of core power domain and debug power domain power states is IMPLEMENTATION DEFINED. Implementations are not required to implement all of these states and might include additional states. These additional states must appear to the debugger as one of the logical power states defined by this model. The control of power states is IMPLEMENTATION DEFINED.

Note

As a result, it is IMPLEMENTATION DEFINED whether it is possible for the debug power domain to be on when the core power domain is off.
H6.4 Emulating low-power states

The control registers DBGPRCR.CORENPDRQ and EDPRCR.COREPURQ provide an interface between the power controller and the PE. They typically map directly to signals in the recommended external debug interface. With this interface the external debugger can request the power controller to:

- Emulate states where the core power domain is completely off or in a low-power state where the core power domain registers cannot be accessed. This simplifies the requirements on software by sacrificing entirely realistic behavior.
- Restore full power to the core power domain.

EDPRSR.\{SPD, PU\} indicates the core power domain power state. For more information see:
- DBGPRCR\_EL1, Debug Power Control Register on page D7-2172 and DBGPRCR, Debug Power Control Register on page G6-4768.
- EDPRCR, External Debug Power/Reset Control Register on page H9-5182.
- EDPRSR, External Debug Processor Status Register on page H9-5185.
- Appendix J2 Recommended External Debug Interface.

The measures to emulate powerdown are IMPLEMENTATION DEFINED. The ability of the debugger to access the state of the PE and the system might be limited as a result of the measures adopted.

In an emulated powerdown state, the debugger must be able to access all debug registers in both the debug power domain and the core power domain as if the core power domain were on. That is, the debugger must be able to read and write to such registers without receiving errors. This allows an external debugger to debug the powerup sequence. To stop the OS Double Lock preventing access to debug registers when powerdown is being emulated, DoubleLockStatus() == FALSE when DBGPRCR.CORENPDRQ == 1.

Otherwise, the behavior of the PE in emulated powerdown must be similar to that in a real powerdown state. In particular, the PE must not respond to other system stimuli, such as interrupts.

Example H6-1 and Example H6-2 are examples of two approaches to emulating powerdown.

**Example H6-1 An example of emulating powerdown**

The PE is held in Standby state, isolated from any system stimuli. It is IMPLEMENTATION DEFINED whether the PE can respond to debug stimuli such as an External Debug Request debug event.

If the PE can enter Debug state, then the external debugger is able to use the ITR to execute instructions, such as loads and stores. This causes the external debugger to interact with the system. If the external debugger restarts the PE, the PE leaves Standby state and restarts fetching instructions from memory.

**Example H6-2 Another example of emulating powerdown**

The PE is held in Warm reset. This limits the ability of an external debugger to access the resources of the PE. For example, the PE cannot be put into Debug state.

On exit from emulated powerdown the PE is reset. However, the debug registers that are only reset by a Cold reset must not be reset. Typically this means that a Warm reset is substituted for the Cold reset.

--- **Note** ---

- Warm reset and Cold reset have different effects apart from resetting the debug registers. In particular, RMR\_ELx is reset by a Cold reset and controls the reset state on a Warm reset. This means that if a Cold reset is substituted by a Warm reset, the behavior of the reset code might be different.
- The timing effects of powering down are typically not factored in the powerdown emulation. Examples of these timing effects are clock and voltage stabilization.
• Emulation does not model the state lost during powerdown, meaning that it might mask errors in the state storage and recovery routines.
H6.5 Debug OS Save and Restore sequences

In ARMv8-A, the following registers provide the OS Save and restore mechanism:

- The *OS Lock Access Register*, OSLAR, locks the OS Lock to restrict access to debug registers before starting an OS Save sequence, and unlocks the OS Lock after an OS Restore sequence.
- The *OS Lock Status Register*, OSLSR, shows the status of the OS Lock.
- The *External Debug Execution Control Register*, EDECR, can be configured to generate a debug event when the OS Lock is unlocked.
- The *OS Double Lock Register*, OSDLR, locks out an external debug interface entirely. This is only used immediately before a powerdown sequence.

See also:
- *Reset and debug* on page H6-5091
- Appendix J5 Example OS Save and Restore Sequences

H6.5.1 Debug registers to save over powerdown

Table H6-1 shows the different requirements for self-hosted debug over powerdown and external debug over powerdown:

- The column labeled Self-hosted lists registers that software must preserve over powerdown so that it can support self-hosted debug over powerdown. This does not require use of the OS Save and Restore mechanism.
- The column labeled External lists registers that software must preserve over powerdown so that it can support external debug over powerdown. This requires use of the OS Save and Restore mechanism:
  - Some external debug registers are not normally accessible to software executing on the PE. Additional debug registers are provided that give software the required access to save and restore these external debug registers when OSLSR.OSLK is locked. These registers include OSECCR, OSDTRRX, and OSDTRTX.
  - Some registers might only present in some implementations, or might not be accessible at all Exception levels or in Non-secure state. DBGVCR32_EL2 and SDER32_EL3 are only required to support AArch32.

Table H6-1 does not include registers for the OPTIONAL Trace and Performance Monitor extensions.

H6.5 Debug OS Save and Restore sequences

**OS Save sequence**

To preserve the debug logic state over a powerdown, the state must be saved to nonvolatile storage. This means the OS Save sequence must:

1. **Lock the OS Lock by:**
   - Writing the key value 0xC5ACCE55 to the DBGOSLAR in AArch32 state.
   - Writing 1 to OSLAR_EL1.OSLK in AArch64 state.
2. Execute an ISB instruction.
3. Walk through the debug registers listed in Debug registers to save over powerdown on page H6-5086 and save the values to the nonvolatile storage.

Before removing power from the core power domain, software must:

1. Lock the OS Double Lock by writing 1 to OSDLR_EL1.DLK.
2. Execute a context synchronization operation.

**OS Restore sequence**

After a powerdown, the OS Restore sequence must perform the following steps to restore the debug logic state from the non-volatile storage:

1. **Lock the OS Lock**, as described in OS Save sequence. The OS Lock is generally locked by the Cold reset, but this step ensures that it is locked.
2. Execute an ISB instruction.
3. To ensure that, if an external debugger clears the OS Lock before the end of this sequence, no debug exceptions are generated:
   - Write 0 to MDSCR_EL1 if executing in AArch64 state.
   - Write 0 to DBGDSCRext if executing in AArch32 state.
4. Walk through the debug registers listed in Debug registers to save over powerdown on page H6-5086, and restore the values from the nonvolatile storage. The last register to be restored must be:
   - MDSCR_EL1 if executing in AArch64 state.
   - DBGDSCRext if executing in AArch32 state.
5. Execute an ISB instruction.

---

a. The OS Lock must be locked to save and restore for external debug. When the OS Lock is locked, DSCR is part of the software save and restore mechanism for external debug. It provides a mechanism for an operating system to access some fields of EDSCR that are otherwise read-only or not visible to software. This allows the operating system to save and restore these settings over a powerdown for the external debugger.

b. This register is new in ARMv8-A. Sequences written for ARMv7 do not preserve the register over powerdown.

c. Read DBGCLAIMCLR to save, write DBGCLAIMSET to restore.
6. Unlock the OS Lock by:
   • Writing any non-key value to DBGOSLAR if executing in AArch32 state.
   • Writing 0 to OSLAR_EL1.OSLK if executing in AArch64 state.

7. Execute a context synchronization operation.

Note
The OS Restore sequence overwrites the debug registers with the values that were saved. If there are valid values in these registers immediately before the restore sequence, then those values are lost.

H6.5.4 Debug behavior when the OS Lock is locked

The main purpose of the OS Lock is to prevent updates to debug registers during an OS Save or OS Restore operation. The OS Lock is locked on a Cold reset.

When the OS Lock is locked:

• Access to debug registers through the system register interface is mainly unchanged except that:
  — Certain registers are read and written without side-effects.
  — Fields in DSCR and OSECCR that are normally read-only become read/write.

  This allows the state to be saved or restored. For more information, see the relevant register description in Chapter H9 External Debug Register Descriptions.

• Access to debug registers by the external debug interface is restricted to prevent an external debugger modifying the registers that are being saved or restored. For more information see External debug interface register access permissions summary on page H8-5110.

• Debug exceptions, other than Software Breakpoint Instruction exceptions are not generated.

The OS Lock has no effect on Software Breakpoint Instruction debug events and Halting debug events.

H6.5.5 Debug behavior when the OS Lock is unlocked

When the OS Lock is unlocked, an OS Unlock Catch debug event is generated if EDECR.OUCE is set to 1. See OS Unlock Catch debug event on page H3-5035.

H6.5.6 Debug behavior when the OS Double Lock is locked

The OS Double Lock is locked immediately before a powerdown sequence. The OS Double Lock ensures that it is safe to remove core power by forcing the debug interfaces to be quiescent.

When DoubleLockStatus() == TRUE:

• The external debug interface only has restricted access to the debug registers, so that it is quiescent before removing power. See External debug interface register access permissions summary on page H8-5110.

• Debug exceptions, other than Software Breakpoint Instruction exceptions, are not generated.

• Halting is prohibited. See Halting allowed and halting prohibited on page H2-4977.

Note
Pending Halting debug events might be lost when core power is removed.

• No asynchronous debug events are WFI or WFE wake-up events.

Software must synchronize the update to OSDLR before it indicates to the system that core power can be removed. The interface between the PE and its power controller is IMPLEMENTATION DEFINED.
Typically software indicates that core power can be removed by entering the Wait For Interrupt state. This means that software must explicitly synchronize the OSDLR update before issuing the WFI instruction.

OSDLR.DLK is ignored and DoubleLockStatus() == FALSE if either:

- The PE is in Debug state.
- DBGPRCR.CORENPDRQ is set to 1.

Note

It is possible to enter Debug state with OSDLR.DLK set to 1. This is because a context synchronization operation is required to ensure the OS Double Lock is locked, meaning that Debug state might be entered before the OSDLR update is synchronized.

Because OSDLR.DLK is ignored when DBGPRCR.CORENPDRQ is set to 1, and an external debugger can write to DBGPRCR.CORENPDRQ, software must not rely on using the OS Double Lock to disable debug exceptions or to prohibit halting, or both. ARM deprecates use of the OS Double Lock for these purposes, and instead recommends that software:

- Uses the OS Lock to disable debug exceptions during save or restore sequences.
- Uses the debug authentication interface to prohibit halting and external debug access to debug registers at times other than immediately prior to removing power.

As the purpose of the OS Double Lock is to ensure that it is safe to remove core power, it is important to avoid race conditions that defeat this purpose. ARM recommends that:

- Once the write to OSDLR.DLK has been synchronized by a Context synchronization operation and DoubleLockStatus() == TRUE, a PE must:
  - Not allow a debug event generated before the Context synchronization operation to cause an entry to Debug state or act as a wake-up event for a WFI or WFE instruction after the context synchronization operation has completed.
  - Complete any external debug access started before the Context synchronization operation by the time the context synchronization operation completes.

Note

A debug register access might be in progress when software sets OSDLR.DLK to 1. An implementation must not permit the synchronization of locking the OS Double Lock to stall indefinitely while waiting for that access to complete. This means that any debug register access that is in progress when software sets OSDLR.DLK to 1 must complete or return an error in finite time.

- If a write to DBGPRCR or EDPRCR made when OSDLR.DLK == 1 changes DBGPRCR.CORENPDRQ or EDPRCR.CORENPDRQ from 1 to 0, meaning DoubleLockStatus() changes from FALSE to TRUE, then before signaling to the system that the CORENPDRQ field has been cleared and emulation of powerdown is no longer requested, meaning the system can remove core power, the PE must ensure that all the requirements for DoubleLockStatus() == TRUE listed in this section are met.

In the standard OS Save sequence, the OS Lock is locked before the OS Double Lock is locked. This means that writes to CORENPDRQ are ignored by the time the OS Double Lock is locked. However, if DoubleLockStatus() == FALSE, an external debugger can clear the OS Lock at any time, and then write to EDPRCR.

The pseudocode for the DoubleLockStatus() function is as follows:

```c
// DoubleLockStatus()
// ================
// Returns the value of EDPRSR.DLK.
// FALSE if OSDLR_EL1.DLK == 0 or DBGPRCR_EL1.CORENPDRQ == 1 or the PE is in Debug state.
// TRUE if OSDLR_EL1.DLK == 1 and DBGPRCR_EL1.CORENPDRQ == 0 and the PE is in Non-debug state.

boolean DoubleLockStatus()

if ELUsingAarch32(EL1) then
    return DBGOSDLR.DLK == '1' && DBGPRCR.CORENPDRQ == '0' && !Halted();
```
else
    return OSDLR_EL1.DLK == '1' && DBGPRCR_EL1.CORENPDREQ == '0' && !Halted();
H6.6 Reset and debug

All registers in the Core power domain are reset either by a Warm reset or a Cold reset, as described in Reset on page D1-1511, including external debug logic registers.

All registers in the Debug power domain are reset by an External Debug reset.

Figure H6-2 shows this reset scheme. The following three reset signals are an example implementation of the reset scheme:

- **CORERESET**, which must be asserted for a Warm reset.
- **CPUPORESET**, which must be asserted for a Cold reset.
- **PRESETDBG**, which must be asserted for an External Debug reset.

![Figure H6-2 Power and reset domains](image)

For more information about power domains and power states, see Power domains and debug on page H6-5081.

When power is first applied to the Debug power domain, **PRESETDBG** must be asserted.

When power is first applied to the Core power domain, **CPUPORESET** must be asserted.

Note

In this scheme, logic in the Warm reset domain is reset by asserting either **CORERESET** or **CPUPORESET**. This implies a particular implementation style that permits these approaches.

**CPUPORESET** is not normally asserted on moving from a low-power state, where power has not been removed, to a full-power state. This can occur, for example, on exiting a low-power retention state. See also Emulating low-power states on page H6-5084 and **EDPRSR, External Debug Processor Status Register** on page H9-5185.

H6.6.1 External debug interface accesses to registers in reset

If a reset signal is asserted and the external debug interface:

- Writes a register, or indirectly writes a register or register field as a side-effect of an access:
  - Then, if the register or register field is reset by that reset signal, it is CONSTRAINED UNPREDICTABLE whether the register or register field takes the reset value or the value written. The reset value might be UNKNOWN.
  - Otherwise the register or register field takes the value that is written.
- Reads a register, or indirectly reads a register or register field, as part of an access:
  - Then, if the register or register field is reset by that reset signal, the value returned in UNKNOWN.
— Otherwise, the value of the register or register field is returned.

It is IMPLEMENTATION DEFINED whether any register can be accessed when External Debug reset is being asserted. The result of these accesses is IMPLEMENTATION DEFINED.
This chapter describes the Sample-based Profiling extension, that is an OPTIONAL extension to the ARMv8 architecture. The extension provides a non-invasive external debug component.

--- Note  

This form of the Sample-based Profiling extension is OPTIONAL. ARM recommends that if extension EDPCSR is not implemented that an alternative IMPLEMENTATION DEFINED form of Sample-based Profiling is implemented.

---

It contains the following section:

- *Sample-based profiling on page H7-5094.*
H7.1 Sample-based profiling

Sample-based profiling is an OPTIONAL extension to the architecture. It provides a mechanism for coarse-grained profiling of software executing on the PE by an external debugger, without changing the behavior of that software. The following sections describe this extension:

- The implemented Sample-based profiling registers.
- Reads of the External Debug Program Counter Sampling Registers.
- Reads of the External Debug Virtual Context Sample Register on page H7-5095.
- Accuracy of sampling on page H7-5095.
- Sample-based Profiling and security on page H7-5096.
- Pseudocode description of Sample-based Profiling on page H7-5096.

H7.1.1 The implemented Sample-based profiling registers

An implementation that includes the Sample-based profiling extension implements the following external debug registers:

- **EDPCSR** is a 64-bit read-only register that contains a sampled program counter value. As external debug register accesses are atomic only at word granularity, EDPCSR is split into two registers: EDPCSRhi and EDPCSRlo. See Reads of the External Debug Program Counter Sampling Registers.

- **EDCIDSR** is a read-only register that contains the sampled value of CONTEXTIDR_EL1 indirectly read on reading EDPSRlo.

  Note
  
  If EL3 is implemented and using AArch32 then CONTEXTIDR is a Banked register and EDCIDSR samples the current Banked copy of CONTEXTIDR.

- **EDVIDSR** is a read-only register that contains sampled values captured on reading EDPSRlo. If neither EL3 nor EL2 are implemented, EDVIDSR is not implemented.

H7.1.2 Reads of the External Debug Program Counter Sampling Registers

A read of the EDPCSRlo normally has the side-effect of indirectly writing to EDCIDSR, EDVIDSR, and EDPCSRhi. When EDPCSRlo is read, the bottom 32 bits of a program counter sample are returned. The top 32 bits are captured in EDPCSRhi and can be read later. However:

- If the PE is in Debug state, or Sample-based Profiling is prohibited, EDPCSRlo reads as 0xFFFFFFFF and EDCIDSR, EDVIDSR and EDPCSRhi become UNKNOWN. See Sample-based Profiling and security on page H7-5096.

- If the PE is in Reset state, the sampled value is UNKNOWN and EDCIDSR, EDVIDSR and EDPCSRhi become UNKNOWN.

- If no instruction has been retired since the PE left Reset state, Debug state, or a state where Sample-based Profiling is prohibited, the sampled value is UNKNOWN and EDCIDSR, EDVIDSR and EDPCSRhi become UNKNOWN.

- The indirect writes to EDCIDSR, EDVIDSR, and EDPCSRhi might not occur for a memory-mapped access to the external debug interface. For more information, see Memory-mapped accesses to the external debug interface on page H8-5106.

The value written to EDCIDSR is an indirect read of CONTEXTIDR_EL1. This means that it is CONSTRAINED UNPREDICTABLE whether EDCIDSR is set to the original or new value if a read of the EDPCSRlo samples:

- An instruction that writes to CONTEXTIDR_EL1.
- The next context synchronization operation.
- Any instruction executed between these two instructions.
Note

In ARMv7 the Sample-based Profiling extension an offset was applied to the sampled program counter value and this offset and the instruction set state indicated in bits [1:0] of the sampled value. In the ARMv8 Sample-based Profiling extension, the sampled value is the address of an instruction that has executed, with no offset and no indication of the instruction set state.

H7.1.3 Reads of the External Debug Virtual Context Sample Register

A read of the EDVIDSR contains sampled values captured on reading EDPSRlo, where:

- **EDVIDSR.NS** indicates the security state associated with the most recent EDPCSR sample.
- **EDVIDSR.E2** indicates whether the most recent EDPCSR sample was associated with EL2. If EDVIDSR.NS == 0, this bit is 0.
- **EDVIDSR.E3** indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64. If EDVIDSR.NS == 1 or the PE was in AArch32 state when EDPCSRlo was read, this bit is 0.
- **EDVIDSR.HV** indicates whether EDPCSRHi is valid, that is, bits [63:32] of the most recent program counter sample are nonzero.

Note

- EDVIDSR.HV == 1 does not mean that EDPCSRHi != 0. EDVIDSR.HV == 0 is a hint that EDPCSRHi does not need to be read.
- Tools must take care to avoid skewing sampled data by over-sampling code for which EDVIDSR.HV == 0.

- **EDVIDSR.VMID** indicates the value of the VTTBR_EL2.VMID register associated with the most recent EDPCSRlo sample. If EDVIDSR.NS == 0 or EDVIDSR.E2 == 1, this field is RAZ. If EL2 is not implemented, EDVIDSR.E2 and EDVIDSR.VMID are RES0.
- If EL3 is not implemented, EDVIDSR.E3 is RES0, and EDVIDSR.NS has a fixed read-only value.

H7.1.4 Accuracy of sampling

Sample-based Profiling is provided as a mechanism for tools to populate a statistical model of the performance of software executing on the PE. The statistical data returned by random sampling of EDPCSR, EDCIDSR, and EDVIDSR must allow such statistical modeling.

It must be possible to sample references to branch targets. It is IMPLEMENTATION DEFINED whether references to other instructions can be sampled. The branch target for a conditional branch instruction that fails its condition check is the instruction that follows the conditional branch instruction. The branch target for an exception is the exception vector address.

Under normal operating conditions, the whole sample, EDPCSR, EDCIDSR, and EDVIDSR, must reference an instruction that was committed for execution, including its context, and must not reference instructions that are fetched but not committed for execution.

To keep the implementation and validation cost low, a reasonable degree of inaccuracy in the sampled data is acceptable. ARM does not define a reasonable degree of inaccuracy but recommends the following guidelines:

- In exceptional circumstances, such as a change in security state or other boundary condition, it is acceptable for the sample to represent an instruction that was not committed for execution.
- Under very unusual non-repeating pathological cases the sample can represent an instruction that was not committed for execution. These cases are likely to occur as a result of asynchronous exceptions, such as interrupts, where the chance of a systematic error in sampling is very unlikely.

See also *Non-invasive behavior* on page D5-1851.
H7.1.5 Sample-based Profiling and security

Sample-based Profiling is a non-invasive external debug component, controlled by an IMPLEMENTATION DEFINED authentication interface. Sample-based Profiling is prohibited unless both:

- Allowed by the IMPLEMENTATION DEFINED authentication interface `ExternalNoninvasiveDebugEnabled()`.
- Any one of:
  - Executing in Non-secure state.
  - EL3 is not implemented.
  - EL3 is implemented, executing in Secure state, and allowed by the IMPLEMENTATION DEFINED authentication interface `ExternalSecureNoninvasiveDebugEnabled()`.
  - EL3 is implemented, EL3 or EL1 is using AArch32, executing at EL0 in Secure state, and `SDER32_EL3.SUNIDEN == 1`.

The state of IMPLEMENTATION DEFINED authentication interface is visible through `DBGAUTHSTATUS_EL1`.

See also Appendix J2 Recommended External Debug Interface.

H7.1.6 Pseudocode description of Sample-based Profiling

PCSample() records a PC sample for the EDPCSR and associated registers.

```pseudocode
PCSample is (
    boolean valid,
    bits(64) pc,
    bits(2) el,
    bit rw,
    bit ns,
    bits(32) contextidr,
    bits(8) vmid
)
PCSample pc_sample;

CreatePCSample()
// In a simple sequential execution of the program, CreatePCSample is executed each time the PE
// executes an instruction that can be sampled. An implementation is not constrained such that
// reads of EDPCSRlo return the current values of PC, etc.
enabled = (if IsSecure() then ExternalSecureNoninvasiveDebugEnabled()
    else ExternalNoninvasiveDebugEnabled());

pc_sample.valid = enabled && !Halted();
pc_sample.pc = ThisInstrAddr();
pc_sample.el = PSTATE.EL;
pc_sample.rw = if UsingAArch32() then '0' else '1';
pc_sample.ns = if IsSecure() then '0' else '1';
pc_sample.contextidr = if ELUsingAArch32(EL1) then CONTEXTIDR else CONTEXTIDR_EL1;
if HaveEL(EL2) && !IsSecure() then
    pc_sample.vmid = if ELUsingAArch32(EL2) then VTTBR.VMID else VTTBR_EL2.VMID;
return;

// EDPCSRlo[] (read)
// ===============
bits(32) EDPCSRlo[boolean memory_mapped]
if EDPRSR<6:5,0> != '001' then
    IMPLEMENTATION_DEFINED "signal slave-generated error";
return bits(32) UNKNOWN;
// The Software lock is OPTIONAL.
```

---

The state of IMPLEMENTATION DEFINED authentication interface is visible through `DBGAUTHSTATUS_EL1`.

See also Appendix J2 Recommended External Debug Interface.
update = !memory_mapped || EDLS.R.LK == '0';  // Software locked: no side-effects

if pc_sample.valid then
    sample = pc_sample.pc<31:0>;
    if update then
        EDPCSRhi = (if pc_sample.rw == '0' then Zeroes(32) else pc_sample.pc<63:32>);
        EDCIDSR = pc_sample.contextidr;
        EDVIDSR.VMID = (if HaveEL(EL2) && pc_sample.ns == '1' && pc_sample.el IN {EL1, EL0} 
                         then pc_sample.vmid else Zeroes(8));
        EDVIDSR.NS = pc_sample.ns;
        EDVIDSR.E2 = (if pc_sample.el == EL2 then '1' else '0');
        EDVIDSR.E3 = (if pc_sample.el == EL3 then '1' else '0') AND pc_sample.rw;
        // The conditions for setting HV are not specified if PCSRhi is zero.
        // An example implementation may be "pc_sample.rw".
        EDVIDSR.HV = (if !IsZero(EDPCSRhi) then '1' else bit IMPLEMENTATION_DEFINED "0 or 1");
    else
        sample = Ones(32);
        if update then
            EDPCSRhi = bits(32) UNKNOWN;
            EDCIDSR = bits(32) UNKNOWN;
            EDVIDSR = (bits(4) UNKNOWN):Zeros(20):(bits(8) UNKNOWN);

return sample;
H7 The Sample-based Profiling Extension
H7.1 Sample-based profiling
Chapter H8
About the External Debug Registers

This chapter provides some additional information about the external debug registers. It contains the following sections:

- *Relationship between external debug and System registers* on page H8-5100.
- *Supported access sizes* on page H8-5101.
- *Synchronization of changes to the external debug registers* on page H8-5102.
- *Memory-mapped accesses to the external debug interface* on page H8-5106.
- *External debug interface register access permissions* on page H8-5108.
- *External debug interface registers* on page H8-5112.
- *Cross-trigger interface registers* on page H8-5117.
- *External debug register resets* on page H8-5119.

______ Note ________

Where necessary, Table J11-1 on page J11-5816 disambiguates the general register references used in this chapter.
H8.1 Relationship between external debug and System registers

Table H8-1 shows the relationship between external debug registers and system registers. Where no relationship exists, the registers are not listed.

- EDPRCSR.CORENPDRQ is a read/write alias for DBGPSCR.CORENPDRQ.
- EDPRCSR.OSLK is a read-only alias for OSLSR.OSLK.
- EDPRCSR.DLK is a read-only function of OSLSR.DLK.

---

*a. This is a word of a 64-bit register.*
H8.2 Supported access sizes

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the debug registers, Performance Monitor registers, and CTI registers, implementations must support:

- Word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations.
- Doubleword-aligned 64-bit accesses to access 64-bit registers mapped to a doubleword-aligned pair of adjacent 32-bit locations.

Note

This means that a system implementing the debug registers using a 32-bit bus, such as an AMBA APB3, with a wider system interconnect must implement a bridge between the system and the debug bus that can split 64-bit accesses.

All registers are only single-copy atomic at word granularity. This means that for 64-bit accesses to a 64-bit register, the system might generate a pair of 32-bit accesses. The order in which the two halves are accessed is not specified.

The following accesses are not supported:

- Byte.
- Halfword.
- Unaligned word. These accesses are not word single-copy atomic.
- Unaligned doubleword. These accesses are not doubleword single-copy atomic.
- Doubleword accesses to a pair of 32-bit locations that are not a doubleword-aligned pair forming a 64-bit register.
- Quadword or higher.
- Exclusive accesses.

For each of these access types, it is CONSTRAINED UNPREDICTABLE whether:

- The access generates an external abort or not.
- The defined side-effects of a read occur or not. A read returns UNKNOWN data.
- A write is ignored or sets the accessed register or registers to UNKNOWN.

For accesses from the external debug interface, the size of an access is determined by the interface. For an access from an ADlv5-compliant Memory Access Port, MEM-AP, this is specified by the MEM-AP CSW register.

See Access sizes for memory-mapped accesses on page H8-5107.
H8.3 Synchronization of changes to the external debug registers

This section describes the synchronization requirements for the external debug interface.

For more information on how these requirements affect debug, see:

- Synchronization and debug exceptions on page D2-1686 for exceptions taken from AArch64 state, or Synchronization and debug exceptions on page G2-4017 for exceptions taken from AArch32 state.

- Synchronization and Halting debug events on page H3-5038.

- Synchronization of DCC and ITR accesses on page H4-5053.

This section refers to accesses from the external debug interface as external reads and external writes. It refers to accesses to system registers as direct reads, direct writes, indirect reads, and indirect writes.

--- Note ---

Synchronization requirements for System registers on page D7-1902 defines direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads, and external writes as indirect writes.

---

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. With the exception of DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, and DBGWVR<n>_EL1, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

Synchronization of DCC and ITR accesses on page H4-5053 describes the synchronization requirements for the DCC and ITR.

Changes to the IMPLEMENTATION DEFINED authentication interface are external writes to the authentication status registers by the master of the authentication interface. See Synchronization and the authentication interface on page H8-5103.

Explicit synchronization is not required for an external read or an external write by an external agent to be observable to a following external read or external write by that agent to the same register using the same address, and so is never required for registers that are accessible only in the external debug interface.

Some registers are guaranteed to be observable to all observers in finite time, without explicit synchronization. For more information, see Synchronization requirements for System registers on page D7-1902. Otherwise, explicit synchronization is normally required following an external write to any register for that write to be observable by:

- A direct access.
- An indirect read by an instruction.
- An external read of the register using a different address.

This means that an external write by an external agent is guaranteed to have an effect on subsequent instructions executed by the PE only if all of the following are true:

- The write has completed.
- The PE has executed a context synchronization operation.
- The context synchronization operation was executed after the write completed.

The order and synchronization of direct reads and direct writes of system registers is defined by Synchronization requirements for System registers on page D7-1902.

The external agent must be able to guarantee completion of a write. For example by:

- Marking the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- Reading back the value written.
- Some guaranteed property of the connection between the PE and the external agent.
Note
For an external Debug Access Port, this is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, a write is guaranteed to complete before the APB-AP allows a second APB transaction to complete.

The external agent and PE can guarantee ordering by, for example, passing messages in an ordered way with respect to the external write and the context synchronization operation, and relying on the memory ordering rules provided by the memory model.

External reads and external writes complete in the order in which they arrive at the PE. For accesses to different register locations the external agent must create this order by:
• Marking the memory as Device-nGnRnE or Device-nGnRE.
• Using the appropriate memory barriers.
• Some guaranteed property of the connection between the PE and the external agent.

Note
For an external Debug Access Port, this is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, accesses complete in order.

However, the external agent cannot force synchronization of completed writes without halting the PE. Executing an ISB instruction, either in Debug state or in Non-debug state, and exiting from Debug state forces synchronization. If the PE is in Debug state, executing an ISB instruction is guaranteed to explicitly synchronize any external reads, external writes, and changes to the authentication interface that are ordered before the external write to EDITR.

For any given observer, external writes to the following register groups are guaranteed to be observable in the same order in which they complete:
• The breakpoint registers, DBGBCR<n>_EL1 and DBGBVR<n>_EL1.
• The watchpoint registers, DBGWCR<n>_EL1 and DBGWVR<n>_EL1.

This guarantee only applies to external writes to registers within one of these groups. There is no guarantee regarding the ordering of the observability of external writes within these groups with respect to external writes to registers, for example EDSCR, or between breakpoints and watchpoints, including watchpoints linked to context matching breakpoints.

Note
This means that a debugger can rely on the external writes to be observed in the same order in which they complete. It does not mean that a debugger can rely on the external writes being observed in finite time.

In a simple sequential execution an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

If two or more interfaces simultaneously access a register, the behavior must be as if the accesses occurred atomically and in any order. This is described in Examples of the synchronization of changes to the external debug registers on page H8-5104.

Some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means that simultaneous writes must be merged. Registers that have this property and support both external debug and system register access include DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, PMCR_EL0.{C,P}, PMOVSET_EL0, PMOVSCLR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, and PMSWINC_EL0. This last register is OPTIONAL and deprecated in the external debug interface.

H8.3.1 Synchronization and the authentication interface
Changes to the authentication interface are indirect writes to the Authentication Status registers by the master of the authentication interface. For each of these Authentication Status registers, it is IMPLEMENTATION DEFINED whether a change on the authentication interface is guaranteed to be observable to an external debug interface read of the register only after a context synchronization operation or in finite time.
For DBGAUTHSTATUS_EL1, a change on the authentication interface is guaranteed to be observable to a system register read of DBGAUTHSTATUS_EL1 only after a context synchronization operation.

H8.3.2 Examples of the synchronization of changes to the external debug registers

Example H8-1, Example H8-2, and Example H8-3 show the synchronization of changes to the external debug registers.

Example H8-1 Order of synchronization of Breakpoint and Watchpoint register writes

Initially DBGBVR<\text{n}>_EL1 is 0x8000 and DBGBCR<\text{n}>_EL1 is 0x0181. This means that a breakpoint is enabled on the halfword T32 instruction at address 0x8000.

A sequence of external writes occurs in the following order:

1. 0x0000 is written to DBGBCR<\text{n}>_EL1, disabling the breakpoint.
2. 0x9000 is written to DBGBVR<\text{n}>_EL1[31:0].
3. 0x0061 is written to DBGBCR<\text{n}>_EL1, enabling a breakpoint on the halfword at address 0x9002.

The external writes must be observable to indirect reads in the same order as the external writes complete. This means that at no point is there a breakpoint enabled on either of the halfwords at address 0x8002 and 0x9000.

Similarly a breakpoint or watchpoint must be disabled:

- If both halves of a 64-bit address have to be updated.
- If any of the DBGBCR<\text{n}>_EL1 or DBGWCR<\text{n}>_EL1 fields are modified at the same time as updating the address.

Example H8-2 Simultaneous accesses to DTR registers

Initially EDSCR.{TXfull, TXU, ERR} are 0. Then:

- 0x00CCDA7A is directly written to DBGDTRTX_EL0 by an MSR instruction.
- DBGDTRTX_EL0 is indirectly read by the external debug interface.

These accesses might happen at the same time and in any order.

If the direct write of 0x00CCDA7A to DBGDTRTX_EL0 is handled first, then:

- The external debug interface read of DBGDTRTX_EL0 clears EDSCR.TXfull to 0.
- EDSCR.{TXU, ERR} are unchanged.
- The external debug interface read returns 0x00CCDA7A.

If the indirect read of DBGDTRTX_EL0 by the external debug interface is handled first, then:

- The external debug interface read of DBGDTRTX_EL0 causes an underrun and as a result EDSCR.{TXU, ERR} are both set to 1.
- The external debug interface returns an UNKNOWN value.
- Writing 0x00CCDA7A to DBGDTRTX_EL0 sets DTRTX to 0x00CCDA7A and EDSCR.TXfull to 1.

Example H8-3 Simultaneous writes to CLAIM registers

Initially all CLAIM tag bits are 0. Then:

- 0x01 is written to DBGCLAIMSET_EL1 by a direct write, followed by an explicit context synchronization operation.
- 0x02 is written to DBGCLAIMSET_EL1 by an external write.

These events might happen at the same time and in either order.
After this:

- **DBGCLAIMCLR_EL1** is read by a direct read.
- **DBGCLAIMCLR_EL1** is read by an external read.

In this case, a direct read can return either 0x01 or 0x03, and the external read can return either 0x02 or 0x03.

The only permitted final result for the CLAIM tags is the value 0x01, because this would be the result regardless of whether 0x01 or 0x02 is written first. This is because the external write is guaranteed to be observable to a direct read in finite time. See *Synchronization requirements for System registers* on page D7-1902.

It is not possible for a direct read to return 0x01 and the external read to return 0x02, because the writes to **DBGCLAIMCLR_EL1** are serialized.

In the following scenario, there is only one permitted result. Both observers observe the value 0x03, and then, at the same time, two writes occur:

- 0x04 is written to **DBGCLAIMSET_EL1** by a direct write, followed by an explicit context synchronization operation.
- 0x01 is written to **DBGCLAIMCLR_EL1** by an external write.

In this case only permitted final result for the CLAIM tags is the value 0x06.
H8.4 Memory-mapped accesses to the external debug interface

Support for memory-mapped access to the external debug interface is OPTIONAL.

If the external debug interface is CoreSight compliant, then an OPTIONAL Software Lock can be implemented for memory-mapped accesses to each component. The Software Locks are controlled by EDLSR and EDLAR, PMLSR and PMLAR, and CTILSR and CTILAR. See Management registers and CoreSight compliance on page J2-5461.

With the exception of these registers and the effect of the Software Lock, the behavior of the memory-mapped accesses is the same as for other accesses to the external debug interface.

Note

The recommended memory-mapped accesses to the external debug interface are not compatible with the memory-mapped interface defined in ARMv7. In particular:

• The memory map is different.
• Memory-mapped accesses do not behave differently to Debug Access Port accesses when OSLSR.OSLK == 1, meaning that the OS Lock is locked.

H8.4.1 Register access permissions for memory-mapped accesses

It is IMPLEMENTATION DEFINED whether unprivileged memory-mapped accesses are allowed. Privileged software is responsible for controlling memory-mapped accesses using the MMU.

If memory-mapped accesses are made through an ADIv5 interface, the Debug Access Port can block the access using DBGSWENABLE. This is outside the scope of the ARMv8-A architecture. See ARM® Debug Interface Architecture Specification ADIv5.0 to ADIv5.2.

Effect of the OPTIONAL Software Lock on memory-mapped access

For memory-mapped accesses, if other controls permit access to a register, the OPTIONAL Software Lock is implemented, and EDLSR.SLK, PMLSR.SLK, or CTILSR.SLK is set to 1, meaning the Software Lock is locked, then with the exception of the LAR itself:

• If other controls permit access to a register, then writes are ignored. That is:
  — Read/write (RW) registers become read-only (RO).
  — Write-only (WO) registers become write-ignored (WI).
• Reads and writes have no side-effects. A side-effect is where a direct read or a direct write of a register creates an indirect write of the same or another register. When the Software Lock is locked, the indirect write does not occur.
• Writes to EDLAR, PMLAR, and CTILAR are unaffected.

This behavior must also apply to all IMPLEMENTATION DEFINED registers.

For example, if EDLSR.SLK is set to 1:

• EDSCR.[TXfull, TXU, ERR] are unchanged by a memory-mapped read from DBGDTRTX_EL0.
• EDSCR.[RXfull, RXO, ERR] are unchanged by a memory-mapped write to DBGDTRRX_EL0 that is ignored.
• EDSCR.[ITE, ITO, ERR] are unchanged by a memory-mapped write to EDITR that is ignored.
• OSLSR.OSLK is unchanged by a memory-mapped write to OSLAR_EL1 that is ignored.
• EDPCSR[63:32], EDCIDSR, and EDVIDSR are unchanged by a memory-mapped read from EDPCSR[31:0].
Note

Updating EDVIDSR, EDCIDSR, and EDPCSRhi are side-effects of reading EDPCSRlo, such that these registers contain the matching context for EDPCSRlo. The process that updates EDPCSRlo with PC samples is not a side-effect of the access. Reads of EDPCSRlo made when the Software Lock is locked can be used to profile software.

- EDPRSR. {SDR, SPMAD, SDAD, SR, SPD} are unchanged by a memory-mapped read from EDPRSR.
- EDPRSR.SDAD is not set if an error response is returned due to a memory-mapped read or write of any debug register as the result of the value of the EDAD field.
- The CLAIM tags are unchanged by memory-mapped writes to DBGCLAIMSET_EL1 and DBGCLAIMCLR_EL1 which are ignored.

Similarly, if PMLSR.SLK is set to 1, then EDPRSR.SPMAD is not set if an error response is returned to a memory-mapped read or write of any Performance Monitors register due to the value of the EPMAD field.

Behavior of a not permitted memory-mapped access

Where the architecture requires that an external debug interface access generates an error response, a memory-mapped access must also generate an error response. However, it is IMPLEMENTATION DEFINED how the error response is handled, as this depends on the system.

ARM recommends that the error is returned as either:
- A synchronous external Data Abort.
- An SError interrupt.

H8.4.2 Synchronization of memory-mapped accesses to external debug registers

The synchronization requirements for memory-mapped accesses to the external debug interface is described in Synchronization of changes to the external debug registers on page H8-5102.

The synchronization requirements between different routes to the external debug interface, that is, between Debug Access Port accesses and memory-mapped accesses are IMPLEMENTATION DEFINED.

H8.4.3 Access sizes for memory-mapped accesses

For memory-mapped accesses from a PE that complies with an ARM architecture, the single-copy atomicity rules for the instruction, the type of instruction, and the type of memory accessed, determine the size of the access made by an instruction. Example H8-4 shows this.

Example H8-4 Access sizes for memory-mapped accesses

Two Load Doubleword instructions made to consecutive doubleword-aligned locations generate a pair of single-copy atomic doubleword reads. However, if the accesses are made to Normal memory or Device-GRE memory they might appear as a single quadword access that is not supported by the peripheral.

ARMv8 does not require the size of each element accessed by a multi-register load or store instruction to be identifiable by the memory system beyond the PE. Any memory-mapped access to a debug register is defined to be beyond the PE.

Software must use a Device-nGRE or stronger memory-type and use only single register load and store instructions to create memory accesses that are supported by the peripheral. For more information, see Memory types and attributes on page B2-93.
H8.5 External debug interface register access permissions

Some external accesses to debug registers and Performance Monitor registers are not permitted and return an error response if:

- The Core power domain is powered down or is in low-power state where the registers cannot be accessed.
- OSLSR.OSLK \( \equiv 1 \). The OS Lock is locked.
- DoubleLockStatus() \( \equiv \text{TRUE} \). The OS Double Lock is locked, that is, EDPRSR.DLK \( \equiv 1 \).
- Access by the external interface is disabled by the authentication interface or secure monitor.

Not all registers are affected in all of these cases. For details, see External debug interface register access permissions summary on page H8-5110.

---

**Note**

OSLR.OSLK is visible through EDPRSR.

---

H8.5.1 External debug over powerdown and locks

Accessing registers using the external debug interface is not possible when the Debug power domain is off. In this case all accesses return an error.

External accesses to debug and Performance Monitors registers in the Core power domain are not permitted and return an error response if:

- The Core power domain is off or in low-power state where the registers cannot be accessed.
- OSLSR.OSLK \( \equiv 1 \), meaning that the OS Lock is locked. This allows software to prevent external debugger modification of the registers while it saves and restores them over powerdown.

---

**Note**

In this case OSLR_EL1 can be accessed, meaning an external debugger can override this lock.

---

- DoubleLockStatus() \( \equiv \text{TRUE} \). This means that the OS Double Lock is locked and EDPRSR.DLK \( \equiv 1 \). The OS Double Lock ensures that it is safe to remove Core power by forcing the debug interface to be quiescent.

See also Debug registers to save over powerdown on page H6-5086.

H8.5.2 External access disabled

Accesses are further controlled by the external authentication interface. An untrusted external debugger cannot program the breakpoint and watchpoint registers to generate spurious debug exceptions. If external invasive debugging is not enabled, these external accesses to the registers are disabled. If EL3 is implemented, then SDCR provides additional external access disable controls for those registers if Secure external invasive debugging is disabled.

The disable applies to:

- DBGVBN<\(n\)>_EL1, Debug Breakpoint Value Registers, \(n = 0 - 15\) on page H9-5129.
- DBGBCRN<\(n\)>_EL1, Debug Breakpoint Control Registers, \(n = 0 - 15\) on page H9-5126.
- DBGWVR<\(n\)>_EL1, Debug Watchpoint Value Registers, \(n = 0 - 15\) on page H9-5141.
- DBGWCR<\(n\)>_EL1, Debug Watchpoint Control Registers, \(n = 0 - 15\) on page H9-5138.

The external debug interface cannot access these registers if either:

- External debugging is not enabled. ExternalInvasiveDebugEnabled() \( \equiv \text{FALSE} \).
- Secure external debugging is not enabled, meaning ExternalSecureInvasiveDebugEnabled() \( \equiv \text{FALSE} \), and any of the following:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented and SDCR.EDAD \( \equiv 1 \).
The following pseudocode outlines the `AllowExternalDebugAccess()` function.

```plaintext
boolean AllowExternalDebugAccess()
// The access may also be subject to OS lock, power-down, etc.
if ExternalInvasiveDebugEnabled() then
    if ExternalSecureInvasiveDebugEnabled() then
        return TRUE;
    elsif HaveEL(EL3) then
        return (if ELUsingAArch32(EL3) then SDCR.EDAD else MDCR_EL3.EDAD) == '0';
    else
        return !IsSecure();
else
    return FALSE;
```

PEs might also provide an optional external debug interface to the Performance Monitor registers. The authentication interface and SDCR provide similar external access disable controls for those registers.

The external debug interface cannot access the Performance Monitor registers if either:

- External non-invasive debug is not enabled. `ExternalNoninvasiveDebugEnabled()` == FALSE.
- Secure external non-invasive debugging is not enabled, `ExternalSecureNoninvasiveDebugEnabled()` == FALSE, and any of:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented and SDCR.EPMAD == 1.

The following pseudocode outlines the `AllowExternalPMUAccess()` function.

```plaintext
boolean AllowExternalPMUAccess()
// The access may also be subject to OS lock, power-down, etc.
if ExternalNoninvasiveDebugEnabled() then
    if ExternalSecureNoninvasiveDebugEnabled() then
        return TRUE;
    elsif HaveEL(EL3) then
        return (if ELUsingAArch32(EL3) then SDCR.EPMAD else MDCR_EL3.EPMAD) == '0';
    else
        return !IsSecure();
else
    return FALSE;
```

**Note**

- ARM recommends that secure software that is not making use of debug hardware does not lock out the external debug interface.
- ARMv8-A does not provide the equivalent control over access to Trace extension registers.

**H8.5.3 Behavior of a not permitted access**

For an external debug interface access by a Debug Access Port, the Debug Access Port receives the error response and must signal this to the external debugger. For an ADIv5 implementation of a Debug Access Port, the error sets a sticky error flag in the Debug Access Port that the debugger can poll, and that suppresses further accesses until it is explicitly cleared.
When an error is returned because external access is disabled, and this is the highest priority error condition, a sticky
error flag in EDPRSR is indirectly written to 1 as a side-effect of the access:
• For a debug register access when AllowExternalDebugAccess() == FALSE, EDPRSR.SDAD is indirectly
  written to 1.
• For Performance Monitor register access when AllowExternalPMUAccess() == FALSE, EDPRSR.SPMAD is
  indirectly written to 1.

The indirect write might not occur for a memory-mapped access to the external debug interface. For more
information, see Register access permissions for memory-mapped accesses on page H8-5106.

If no error is returned, or the error is returned because of a higher priority error condition, the flag in EDPRSR is
unchanged.

See also Behavior of a not permitted memory-mapped access on page H8-5107.

For more information, see ARM® Debug Interface Architecture Specification.

H8.5.4  Trapping software access to debug registers

When EDSCR.TDA == 1, software access to the breakpoint and watchpoint registers generate a Halting debug
event and entry to Debug state. For more information see Software Access debug event on page H3-5037.

H8.5.5  External debug interface register access permissions summary

For accesses to:
• IMPLEMENTATION DEFINED registers, see IMPLEMENTATION DEFINED registers.
• OPTIONAL registers for CoreSight compliance, see OPTIONAL CoreSight management registers.
• Reserved, unallocated, or unimplemented registers, writes to read-only registers, and reads of write-only
  registers, see Reserved and unallocated registers.

For all other external debug interface, CTI, and Performance Monitor registers, Table H8-3 on page H8-5115,
Table H8-4 on page H8-5117 and Table I2-1 on page I2-5265, show the response of the PE to accesses by the
external debug interface.

H8.5.6  IMPLEMENTATION DEFINED registers

For debug registers, Performance Monitors registers, CTI registers, IMPLEMENTATION DEFINED register access
permissions are IMPLEMENTATION DEFINED. The power domain in which these registers are implemented is also
IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there are additional constraints
on memory-mapped accesses to registers. These constraints must also apply to IMPLEMENTATION DEFINED registers.
In particular, if the OPTIONAL Software Lock is locked, writes are ignored and accesses have no side-effects. For
more information see Register access permissions for memory-mapped accesses on page H8-5106.

H8.5.7  OPTIONAL CoreSight management registers

Compliance with CoreSight architecture requires additional registers in the range 0xF00 - 0xFFF that are always
accessible. See Management registers and CoreSight compliance on page J2-5461.

H8.5.8  Reserved and unallocated registers

The following information relates to certain types of reserved accesses:
• Reads and writes of unallocated locations. These accesses are reserved for the architecture.
• Reads and writes of locations for features that are not implemented, including:
  — OPTIONAL features that are not implemented.
— Breakpoints and watchpoints that are not implemented.
— Performance Monitors counters that are not implemented.
— CTI triggers that are not implemented.

These accesses are reserved.

- Reads of WO locations. These accesses are reserved for the architecture.
- Writes to RO locations. These accesses are reserved for the architecture.

Reserved accesses normally RAZ/WI. However, software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

--- Note ---
Reads of WO and writes to RO refers to the default access permissions for a register. For example, when the SLK field is set, meaning that the relevant registers become RO, a memory-mapped write to a RW register is ignored, and not treated as a reserved access.

The following reserved registers are RES0 in all conditions, other than when debug power is off:

- If the implementation is CoreSight architecture compliant, all reserved registers in the range 0xF00 - 0xFFC.
  See Management register access permissions on page H8-5462.
- All unallocated Processor ID Registers. That is, unallocated debug registers in the range 0xD00-0xDFC.
- All reserved CTI registers.

Otherwise, the architecture defines that:

1. If debug power is off, all register accesses, including reserved accesses, return an error.
2. For reserved debug registers and Performance Monitors registers, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0, when any of the following hold:
   
   Off       The Core power domain is either completely off or in a low-power state in which the Core power domain registers cannot be accessed.
   
   DLK       DoubleLockStatus() == TRUE. The OS Double Lock is locked, that is, EDPRSR.DLK == 1.
   
   OSLK      OSLR.OSLK == 1. The OS Lock is locked.
3. In addition, for reserved debug registers in the address ranges 0x400 - 0x4FC and 0x800 - 0x8FC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:
   
   EDAD      AllowExternalDebugAccess() == FALSE. External debug is disabled.
   
--- Note ---
See also Behavior of a not permitted access on page H8-5109.

4. In addition, for reserved Performance Monitors registers in the address ranges 0x000 - 0x0FC and 0x400 - 0x47C, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:
   
   EPMAD     AllowExternalPMUAccess() == FALSE. External Performance Monitor access is disabled.
   
--- Note ---
See also Behavior of a not permitted access on page H8-5109.
### H8.6 External debug interface registers

The external debug interface register map is described by:

- Performance Monitors memory-mapped register views on page I3-5271.
- Cross-trigger interface registers on page H8-5117.
- Table H8-2.

a. Only if the OPTIONAL Sample-based Profiling extension is implemented.
b. A 64-bit register mapped to a pair of 32-bit locations. Doubleword accesses to this register are not guaranteed to be 64-bit single copy atomic. See Supported access sizes on page H8-5101. Software must ensure a breakpoint or watchpoint is disabled before altering the value register.
c. Implemented breakpoints and watchpoints only. \( n \) is the breakpoint or the watchpoint number.

---

**Note**

All other locations are reserved.
### Access permissions for the External debug interface registers

Table H8-3 on page H8-5115 shows the access permissions for the external debug interface registers in an ARMv8-A Debug implementation. The terms are defined as follows:

<table>
<thead>
<tr>
<th>Domain</th>
<th>This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>This lists the conditions under which the access is attempted. To determine the access permissions for a register, read these columns from left to right, and stop at first column which lists the condition as being true. The conditions are:</td>
</tr>
<tr>
<td>Off</td>
<td>EDPRSR.PU == 0. The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed.</td>
</tr>
<tr>
<td>Note</td>
<td>If debug power is off, then all external debug interface accesses return an error.</td>
</tr>
<tr>
<td>DLK</td>
<td>DoubleLockStatus() == TRUE. The OS Double Lock is locked, that is, EDPRSR.DLK == 1.</td>
</tr>
<tr>
<td>OSLK</td>
<td>OSLR.OSLK == 1. The OS Lock is locked.</td>
</tr>
<tr>
<td>EDAD</td>
<td>AllowExternalDebugAccess() == FALSE. External debug access is disabled. See also Behavior of a not permitted access on page H8-5109.</td>
</tr>
<tr>
<td>EPMAD</td>
<td>AllowExternalPMUAccess() == FALSE. Access to the external Performance Monitors is disabled. See also Behavior of a not permitted access on page H8-5109.</td>
</tr>
<tr>
<td>Default</td>
<td>This provides the default access permissions, if there are no conditions that prevent access to the register.</td>
</tr>
<tr>
<td>SLK</td>
<td>This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See Register access permissions for memory-mapped accesses on page H8-5106. For all other accesses, this column is ignored.</td>
</tr>
</tbody>
</table>

The access permissions are:

- This means that the default access permission applies. See the Default column, or the SLK column, if applicable. |
| RO | This means that the register or field is read-only. |
| RW | This means that the register or field is read/write. Individual fields within the register might be RO. See the relevant register description for details. |
| RC | This means that the bit clears to 0 after a read. |
| (SE) | This means that accesses to this register have indirect write side-effects. A side-effect occurs when a direct read or a direct write of a register creates an indirect write to the same register or to another register. |
| WO | This means that the register or field is write-only. |
| WI | This means that the register or field ignores writes. |
| IMP DEF | This means that the access permissions are IMPLEMENTATION DEFINED. |
If OPTIONAL memory-mapped access to the external debug interface is supported, there might be additional constraints on memory-mapped accesses. See Register access permissions for memory-mapped accesses on page H8-5106.

</table>

- Only if the Sample-based profiling extension is implemented.
- Some control bits are in the Core power domain. These bits ignore writes when Core power domain registers cannot be accessed as shown.
- Some status bits are fetched from the Core power domain. These bits read **UNKNOWN** when Core power domain registers cannot be accessed as shown.
- Implemented breakpoints and watchpoints only. \( n \) is the breakpoint or watchpoint number.

For the reset values for the external debug interface registers, see Table H8-6 on page H8-5119.
H8.7 Cross-trigger interface registers

The embedded Cross-trigger Interface, CTI, is located within its own block of the external debug memory map. There must be one such block for each PE.

If the CTI of a PE does not implement the CTIDEVAFF0 or CTIDEVAFF1 registers it must be located 64KB above the debug registers in the external debug interface.

Table H8-4 shows the CTI register map.

\textsuperscript{a} Implemented triggers only (including triggers that are not connected). \( n \) is the trigger number.

For the reset values of the CTI registers, see Table H8-7 on page H8-5120.
H8.8 External debug register resets

Each register or field has a defined reset domain:

- Registers and fields in the Warm reset domain are also reset by a Cold reset and unchanged by an External Debug reset that is not coincident with a Cold reset or a Warm reset.

- Registers and fields in the Cold reset domain are unchanged by a Warm reset or an External Debug reset that is not coincident with a Cold reset.

- Registers and fields in the External Debug reset domain are unchanged by a Cold reset or a Warm reset that is not coincident with an External Debug reset.

Table H8-6 and Table H8-7 on page H8-5120 show the external debug register and CTI register resets. For other debug registers and Performance Monitors registers, see Management register resets on page J2-5466 and Power domains and Performance Monitors registers reset on page I2-5266.

--- Note ---

By reference to Figure H6-2 on page H6-5091 the power domain can be deduced from the reset domain. Table J2-7 on page J2-5466 also shows reset power domains.

--- Note ---

Table H8-6 and Table H8-7 on page H8-5120 do not include:

- Read-only identification registers, such as Processor ID Registers and PMCFGR, that have a fixed value from reset.

- Read-only status registers, such as EDSCR.RW, that are evaluated each time the register is read and that have no meaningful reset value.

- Write-only registers, such as EDRCR, that only have an effect on writes, and have no meaningful reset value.

- Read/write registers, such as breakpoint and watchpoint registers, and EDPRCR.CORENPDRQ, that alias other registers. The reset values are described by the descriptions of those other registers.

- IMPLEMENTATION DEFINED registers. The reset values and reset domains of these registers are also IMPLEMENTATION DEFINED and might be UNKNOWN.

All other fields in the registers are set to an IMPLEMENTATION DEFINED value, that can be UNKNOWN. The register is in the specified reset domain.

--- Note ---

An IMPLEMENTATION DEFINED reset value, which can be UNKNOWN, means that hardware is not required to reset the register on the specified reset, but software must not rely on the register being preserved over reset.

Chapter H9
External Debug Register Descriptions

This chapter provides a description of the external debug registers.

It contains the following sections:
• Introduction on page H9-5122.
• Debug registers on page H9-5123.
• Cross-Trigger Interface registers on page H9-5206.
H9.1 Introduction

This section lists the registers that are accessible through the external debug interface.
H9.2 Debug registers

This section lists the Debug registers.
H9.2.1  DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

External register DBGAUTHSTATUS_EL1 is architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1.

External register DBGAUTHSTATUS_EL1 is architecturally mapped to AArch32 System register DBGAUTHSTATUS.

DBGAUTHSTATUS_EL1 is in the Debug power domain.

**Attributes**

DBGAUTHSTATUS_EL1 is a 32-bit register.

**Field descriptions**

The DBGAUTHSTATUS_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td>SNID</td>
<td>SID</td>
<td>NSID</td>
<td>NSNID</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Secure non-invasive debug. Possible values of this field are:

- 00: Not implemented. EL3 is not implemented and the implemented Security state is Non-Secure state.
- 10: Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
- 11: Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

**SID, bits [5:4]**

Secure invasive debug. Possible values of this field are:

- 00: Not implemented. EL3 is not implemented and the implemented Security state is Non-Secure state.
- 10: Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
- 11: Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.
Other values are reserved.

**NSNID, bits [3:2]**

Non-secure non-invasive debug. Possible values of this field are:

- **00**: Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
- **10**: Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
- **11**: Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

**NSID, bits [1:0]**

Non-secure invasive debug. Possible values of this field are:

- **00**: Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
- **10**: Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
- **11**: Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

Other values are reserved.

**Accessing the DBGAUTHSTATUS_EL1:**

DBGAUTHSTATUS_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF88</td>
</tr>
</tbody>
</table>
H9.2.2  DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

**Purpose**
Holds control information for a breakpoint. Forms breakpoint n together with value register
DBGBVR<n>_EL1, where n is 0 to 15.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EDAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

When the E field is zero, all the other fields in the register are ignored.

**Configurations**
External register DBGBCR<n>_EL1 is architecturally mapped to AArch64 System register
DBGBCR<n>_EL1.
External register DBGBCR<n>_EL1 is architecturally mapped to AArch32 System register
DBGBCR<n>.
DBGBCR<n>_EL1 is in the Core power domain.

**Attributes**
DBGBCR<n>_EL1 is a 32-bit register.

**Field descriptions**
The DBGBCR<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>9</th>
<th>8</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>BT</td>
<td>LBN</td>
<td>SSC</td>
<td>RES0</td>
<td>BAS</td>
<td>PMC</td>
<td>E</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:24]**
Reserved, RES0.

**BT, bits [23:20]**
Breakpoint Type. Possible values are:
- 0000  Unlinked instruction address match.
- 0001  Linked instruction address match.
- 0010  Unlinked context ID match.
- 0011  Linked context ID match.
- 0100  Unlinked instruction address mismatch.
- 0101  Linked instruction address mismatch.
- 1000  Unlinked VMID match.
- 1001  Linked VMID match.
1010    Unlinked VMID and context ID match.
1011    Linked VMID and context ID match.

The field breaks down as follows:

- **BT[3:1]: Base type.**
  - 000    Match address. \texttt{DBGVR<n>\_EL1} is the address of an instruction.
  - 010    Mismatch address. Behaves as type 000 if in an AArch64 translation, or if Halting debug is enabled and halting is allowed. Otherwise, \texttt{DBGVR<n>\_EL1} is the address of an instruction to be stepped.
  - 001    Match context ID. \texttt{DBGVR<n>\_EL1[31:0]} is a context ID.
  - 100    Match VMID. \texttt{DBGVR<n>\_EL1[39:32]} is a VMID.
  - 101    Match VMID and context ID. \texttt{DBGVR<n>\_EL1[31:0]} is a context ID, and \texttt{DBGVR<n>\_EL1[39:32]} is a VMID.

- **BT[0]: Enable linking.**
  If the breakpoint is not context-aware, BT[3] and BT[1] are RES0. If EL2 is not implemented, BT[3] is RES0. If EL1 using AArch32 is not implemented, BT[2] is RES0.
  The values 011x and 11xx are reserved, but must behave as if the breakpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

**LBN, bits [19:16]**
Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

**SSC, bits [15:14]**
Security state control. Determines the Security states under which a breakpoint debug event for breakpoint \(n\) is generated. This field must be interpreted along with the HMC and PMC fields.

**HMC, bit [13]**
Higher mode control. Determines the debug perspective for deciding when a breakpoint debug event for breakpoint \(n\) is generated. This field must be interpreted along with the SSC and PMC fields.

**Bits [12:9]**
Reserved, RES0.

**BAS, bits [8:5]**
Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64-only implementation, this field is reserved, RES1. Otherwise:

- BAS[2] and BAS[0] are read/write.
- BAS[3] and BAS[1] are read-only copies of BAS[2] and BAS[0] respectively.

The values 0011 and 1100 are only supported if AArch32 is supported at any Exception level. The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0011</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for T32 instructions.</td>
</tr>
<tr>
<td>1100</td>
<td>DBGBVR&lt;n&gt;_EL1+2</td>
<td>Use for T32 instructions.</td>
</tr>
<tr>
<td>1111</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for A64 and A32 instructions.</td>
</tr>
</tbody>
</table>
0000 is reserved and must behave as if the breakpoint is disabled or map to a permitted value.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Step instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>-</td>
<td>Use for a match anywhere breakpoint.</td>
</tr>
<tr>
<td>0011</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for stepping T32 instructions.</td>
</tr>
<tr>
<td>1100</td>
<td>DBGBVR&lt;n&gt;_EL1+2</td>
<td>Use for stepping T32 instructions.</td>
</tr>
<tr>
<td>1111</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for stepping A64 and A32 instructions.</td>
</tr>
</tbody>
</table>

For Context matching breakpoints, this field is RES1 and ignored.

**Bits [4:3]**

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

**E, bit [0]**

Enable breakpoint DBGBVR<n>_EL1. Possible values are:

- 0: Breakpoint disabled.
- 1: Breakpoint enabled.

**Accessing the DBGBCR<n>_EL1:**

DBGBCR<n>_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x408 + 16n</td>
</tr>
</tbody>
</table>
H9.2.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

**Purpose**

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1, where n is 0 to 15.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EDAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register DBGBVR<n>_EL1 is architecturally mapped to AArch64 System register DBGBVR<n>_EL1.

External register DBGBVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGBVR<n>.

External register DBGBVR<n>_EL1[63:32] is architecturally mapped to AArch32 System register DBGBXVR<n>.

DBGBVR<n>_EL1 is in the Core power domain.

**Attributes**

DBGBVR<n>_EL1 is a 64-bit register.

**Field descriptions**

The DBGBVR<n>_EL1 bit assignments are:

*When DBGBCR<n>_EL1.BT==0b0x0x:*

![Bit Assignments Diagram]

**RESS, bits [63:49]**

Reserved, Sign extended. Hardwired to the value of the sign bit, bit [48]. Hardware and software must treat this field as RES0 if bit[48] is 0, and as RES1 if bit[48] is 1.

**VA, bits [48:2]**

If the address is being matched in an AArch64 stage 1 translation regime, this field contains bits[48:2] of the address for comparison.

If the address is being matched in an AArch32 stage 1 translation regime, the first 16 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

**Bits [1:0]**

Reserved, RES0.
When DBGBCR\(_n\)-EL1.BT==0b0x1x:

\[
\begin{array}{c|c}
63 & 32 \ 31 \\
\hline
\text{RES0} & \text{ContextID} \\
\end{array}
\]

Bits [63:32]
Reserved, RES0.

ContextID, bits [31:0]
Context ID value for comparison.

When DBGBCR\(_n\)-EL1.BT==0b1x0x and EL2 implemented:

\[
\begin{array}{c|c|c}
63 & 40 \ 39 & 32 \ 31 \\
\hline
\text{RES0} & \text{VMID} & \text{RES0} \\
\end{array}
\]

Bits [63:40]
Reserved, RES0.

VMID, bits [39:32]
VMID value for comparison.

Bits [31:0]
Reserved, RES0.

When DBGBCR\(_n\)-EL1.BT==0x1x1x and EL2 implemented:

\[
\begin{array}{c|c|c}
63 & 40 \ 39 & 32 \ 31 \\
\hline
\text{RES0} & \text{VMID} & \text{ContextID} \\
\end{array}
\]

Bits [63:40]
Reserved, RES0.

VMID, bits [39:32]
VMID value for comparison.

ContextID, bits [31:0]
Context ID value for comparison.

Accessing the DBGBVR\(_n\)_EL1:

DBGBVR\(_n\)_EL1[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x400 + 16n</td>
</tr>
</tbody>
</table>
DBGBVR<\text{n}>_EL[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x404 + 16n</td>
</tr>
</tbody>
</table>
H9.2.4 DBGCLAIMCLR_EL1, Debug Claim Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

**Purpose**

Used by software to read the values of the CLAIM bits, and to clear these bits to 0.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register DBGCLAIMCLR_EL1 is architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1.

External register DBGCLAIMCLR_EL1 is architecturally mapped to AArch32 System register DBGCLAIMCLR.

DBGCLAIMCLR_EL1 is in the Core power domain.

**Attributes**

DBGCLAIMCLR_EL1 is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RAZ/SBZ</td>
<td>CLAIM</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Claim clear bits. Reading this field returns the current value of the CLAIM bits.

Writing a 1 to one of these bits clears the corresponding CLAIM bit to 0. This is an indirect write to the CLAIM bits.

A single write operation can clear multiple bits to 0. Writing 0 to one of these bits has no effect.

**Accessing the DBGCLAIMCLR_EL1:**

DBGCLAIMCLR_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA4</td>
</tr>
</tbody>
</table>
H9.2.5 DBGCLAIMSET_EL1, Debug Claim Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

**Purpose**

Used by software to set CLAIM bits to 1.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register DBGCLAIMSET_EL1 is architecturally mapped to AArch64 System register DBGCLAIMSET_EL1.

External register DBGCLAIMSET_EL1 is architecturally mapped to AArch32 System register DBGCLAIMSET.

DBGCLAIMSET_EL1 is in the Core power domain.

**Attributes**

DBGCLAIMSET_EL1 is a 32-bit register.

**Field descriptions**

The DBGCLAIMSET_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ/SBZ</td>
<td>CLAIM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Claim set bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM bit to 1. This is an indirect write to the CLAIM bits.

A single write operation can set multiple bits to 1. Writing 0 to one of these bits has no effect.

**Accessing the DBGCLAIMSET_EL1:**

DBGCLAIMSET_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA0</td>
</tr>
</tbody>
</table>
H9.2.6   DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communications Channel.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

Configurations

External register DBGDTRRX_EL0 is architecturally mapped to AArch64 System register DBGDTRRX_EL0.

External register DBGDTRRX_EL0 is architecturally mapped to AArch32 System register DBGDTRRXint.

DBGDTRRX_EL0 is in the Core power domain.

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

The DBGDTRRX_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update DTRRX</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:0]

Update DTRRX.

If RXfull is set to 0, then writes to this register update the value in DTRRX and set RXfull to 1. Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.
Accessing the DBGDTRRX_EL0:

DBGDTRRX_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x080</td>
</tr>
</tbody>
</table>
H9.2.7   DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. It is a component of the Debug Communication Channel.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

Configurations

External register DBGDTRTX_EL0 is architecturally mapped to AArch64 System register DBGDTRTX_EL0.

External register DBGDTRTX_EL0 is architecturally mapped to AArch32 System register DBGDTRTXint.

DBGDTRTX_EL0 is in the Core power domain.

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

The DBGDTRTX_EL0 bit assignments are:

31  0

Return DTRTX

Bits [31:0]

Return DTRTX.

If TXfull is set to 1, then reads of this register return the value in DTRTX and clear TXfull to 0. Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.
Accessing the DBGDTRTX_EL0:

DBGDTRTX_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x08C</td>
</tr>
</tbody>
</table>
H9.2.8 DBGWCR<\textit{n}> _EL1, Debug Watchpoint Control Registers, \( n = 0 \text{ - 15} \)

The DBGWCR<\textit{n}> _EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint \( n \) together with value register DBGWVR<\textit{n}> _EL1, where \( n \) is 0 to 15.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EDAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

When the E field is zero, all the other fields in the register are ignored.

**Configurations**

External register DBGWCR<\textit{n}> _EL1 is architecturally mapped to AArch64 System register DBGWCR<\textit{n}> _EL1.

External register DBGWCR<\textit{n}> _EL1 is architecturally mapped to AArch32 System register DBGWCR<\textit{n}>.

DBGWCR<\textit{n}> _EL1 is in the Core power domain.

**Attributes**

DBGWCR<\textit{n}> _EL1 is a 32-bit register.

**Field descriptions**

The DBGWCR<\textit{n}> _EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31 29 28 24 23 21 20 19 16 15 14 13 12 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

| 0000 | No mask. |
| 0001 | Reserved. |
| 0010 | Reserved. |

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCR\textit{n} _EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.
Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0xFFFFFFFF mask for address).

Bits [23:21]  
Reserved, RES0.

WT, bit [20]  
Watchpoint type. Possible values are:
0 Unlinked data address match.
1 Linked data address match.

LBN, bits [19:16]  
Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

SSC, bits [15:14]  
Security state control. Determines the Security states under which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

HMC, bit [13]  
Higher mode control. Determines the debug perspective for deciding when a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

BAS, bits [12:5]  
Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x0x0000</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1</td>
</tr>
<tr>
<td>x0x0010</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1+1</td>
</tr>
<tr>
<td>x0x1000</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1+2</td>
</tr>
<tr>
<td>x0x1010</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1+3</td>
</tr>
</tbody>
</table>

In cases where DBGWVR<n>_EL1 addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;n&gt;_EL1[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>x0x0100</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1+4</td>
</tr>
<tr>
<td>x0x1100</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1+5</td>
</tr>
<tr>
<td>x110000</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1+6</td>
</tr>
<tr>
<td>1000000</td>
<td>Match byte at DBGWVR&lt;n&gt;_EL1+7</td>
</tr>
</tbody>
</table>

The valid values for BAS are 0b0000000, or a binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software.

If BAS is zero, no bytes are watched by this watchpoint. Ignored if E is 0.
LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made.
Possible values of this field are:
01  Match instructions that load from a watchpointed address.
10  Match instructions that store to a watchpointed address.
11  Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.
Ignored if E is 0.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

E, bit [0]

Enable watchpoint n. Possible values are:
0  Watchpoint disabled.
1  Watchpoint enabled.

Accessing the DBGWCR<n>_EL1:

DBGWCR<n>_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x808 + 16n</td>
</tr>
</tbody>
</table>
H9.2.9 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1, where n is 0 to 15.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EDAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register DBGWVR<n>_EL1 is architecturally mapped to AArch64 System register DBGWVR<n>_EL1.

External register DBGWVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGWVR<n>.

DBGWVR<n>_EL1 is in the Core power domain.

**Attributes**

DBGWVR<n>_EL1 is a 64-bit register.

**Field descriptions**

The DBGWVR<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RESS</td>
</tr>
<tr>
<td>49</td>
<td></td>
</tr>
<tr>
<td>48</td>
<td>VA</td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**RESS, bits [63:49]**

Reserved, Sign extended. Hardwired to the value of the sign bit, bit [48]. Hardware and software must treat this field as RES0 if bit[48] is 0, and as RES1 if bit[48] is 1.

**VA, bits [48:2]**

Bits[48:2] of the address value for comparison.

**Bits [1:0]**

Reserved, RES0.
Accessing the DBGWVR<n>_EL1:

DBGWVR<n>_EL1[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x800 + 16n</td>
</tr>
</tbody>
</table>

DBGWVR<n>_EL1[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x804 + 16n</td>
</tr>
</tbody>
</table>
H9.2.10  EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th></th>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes</td>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations

It is IMPLEMENTATION DEFINED whether EDACR is in the Core power domain or in the Debug power domain.

Attributes

EDACR is a 32-bit register.

Field descriptions

The EDACR bit assignments are:

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the EDACR:

EDACR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x94</td>
</tr>
</tbody>
</table>
H9.2.11   EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

EDCIDR0 is in the Debug power domain.
EDCIDR0 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**

EDCIDR0 is a 32-bit register.

**Field descriptions**

The EDCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8</td>
<td>PRMBL_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as 0x0D.

**Accessing the EDCIDR0:**

EDCIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF0</td>
</tr>
</tbody>
</table>
H9.2.12   EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

EDCIDR1 is in the Debug power domain.
EDCIDR1 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

The EDCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>CLASS</td>
<td>PRMBL_1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class. Reads as 0x9, debug component.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Accessing the EDCIDR1:

EDCIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF4</td>
</tr>
</tbody>
</table>
H9.2.13  EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

EDCIDR2 is in the Debug power domain.

EDCIDR2 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR2 is a 32-bit register.

**Field descriptions**

The EDCIDR2 bit assignments are:

```
  31  8  7  0
     RES0 PRMBL_2
```

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Must read as 0x05.

**Accessing the EDCIDR2:**

EDCIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF8</td>
</tr>
</tbody>
</table>
H9.2.14    EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

Configurations

EDCIDR3 is in the Debug power domain.

EDCIDR3 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions

The EDCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PRMBL_3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble. Must read as 0xB1.

Accessing the EDCIDR3:

EDCIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFFC</td>
</tr>
</tbody>
</table>
H9.2.15 EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

**Purpose**
Contains the sampled value of CONTEXTIDR_EL1, captured on reading the low half of EDPCSR.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**
EDCIDSR is in the Core power domain.

**Attributes**
EDCIDSR is a 32-bit register.

**Field descriptions**
The EDCIDSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>CONTEXTIDR</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
</tbody>
</table>

**CONTEXTIDR, bits [31:0]**
The sampled value of CONTEXTIDR_EL1, captured on reading the low half of EDPCSR.
If EL3 is implemented and using AArch32 then CONTEXTIDR is a Banked register, and EDCIDSR samples the current Banked copy of CONTEXTIDR.
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on Cold reset.

**Accessing the EDCIDSR:**
EDCIDSR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xA4</td>
</tr>
</tbody>
</table>
H9.2.16   EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

**Usage constraints**

This register is accessible as follows:

---

<table>
<thead>
<tr>
<th>Configurations</th>
</tr>
</thead>
<tbody>
<tr>
<td>EDDEVAFF0 is in the Debug power domain.</td>
</tr>
<tr>
<td>EDDEVAFF0 is optional to implement in the external register interface.</td>
</tr>
</tbody>
</table>

**Attributes**

EDDEVAFF0 is a 32-bit register.

**Field descriptions**

The EDDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>MPIDR_EL1 low half</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the EDDEVAFF0:**

EDDEVAFF0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA8</td>
</tr>
</tbody>
</table>
H9.2.17   EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE
in a multiprocessor system the external debug component relates to.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Configurations**

EDDEVAFF1 is in the Debug power domain.
EDDEVAFF1 is optional to implement in the external register interface.

**Attributes**

EDDEVAFF1 is a 32-bit register.

**Field descriptions**

The EDDEVAFF1 bit assignments are:

```
+---------+---------+
| 31      | 0        |
+---------+---------+
| MPIDR_EL1 high half |
+---------+---------+
```

**Bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest
implemented Exception level.

**Accessing the EDDEVAFF1:**

EDDEVAFF1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFAC</td>
</tr>
</tbody>
</table>

H9.2.18 EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

**Purpose**

Identifies the programmers’ model architecture of the external debug component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

EDDEVARCH is in the Debug power domain.

EDDEVARCH is optional to implement in the external register interface.

**Attributes**

EDDEVARCH is a 32-bit register.

**Field descriptions**

The EDDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>REVISION</td>
<td>ARCHID</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For debug, this is ARM Limited.

Bits [31:28] are the JEP 106 continuation code, 0x4.

Bits [27:21] are the JEP 106 ID code, 0x3B.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVAR is present.

This field is 1 in ARMv8.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For debug, the revision defined by ARMv8 is 0x0.

All other values are reserved.

**ARCHID, bits [15:0]**

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For debug:

- Bits [15:12] are the architecture version, 0x6.
- Bits [11:0] are the architecture part number, 0xA15.
This corresponds to the ARMv8 debug architecture version.

**Accessing the EDDEVARCH:**

EDDEVARCH can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFBC</td>
</tr>
</tbody>
</table>
H9.2.19   EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

**Purpose**

Provides extra information for external debuggers about features of the debug implementation.

**Usage constraints**

This register is accessible as follows:

```
+-------------------+-------------------+-------------------+
| Default            | RO                |
+-------------------+-------------------+
```

**Configurations**

EDDEVID is in the Debug power domain.

**Attributes**

EDDEVID is a 32-bit register.

**Field descriptions**

The EDDEVID bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>AuxRegs</td>
<td>RES0</td>
<td>PCSample</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**AuxRegs, bits [27:24]**

Indicates support for Auxiliary registers. Permitted values for this field are:

- **0000**  None supported.
- **0001**  Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

**Bits [23:4]**

Reserved, RES0.

**PCSample, bits [3:0]**

Indicates the level of Sample-based profiling support using external debug registers 40 through 43. Permitted values of this field in ARMv8 are:

- **0000**  Architecture-defined form of Sample-based profiling not implemented.
- **0010**  EDPCSR and EDCIDSR are implemented (only permitted if EL3 and EL2 are not implemented).
- **0011**  EDPCSR, EDCIDSR, and EDVIDSR are implemented.

All other values are reserved.
Accessing the EDDEVID:

EDDEVID can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC8</td>
</tr>
</tbody>
</table>
H9.2.20  EDDEV1D1, External Debug Device ID register 1

The EDDEV1D1 characteristics are:

Purpose
Provides extra information for external debuggers about features of the debug implementation.

Usage constraints
This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

Configurations
EDDEV1D1 is in the Debug power domain.

Attributes
EDDEV1D1 is a 32-bit register.

Field descriptions
The EDDEV1D1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:4]</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PCSROffset</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:4]
Reserved, RES0.

PCSROffset, bits [3:0]
This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in ARMv8 are:

| 0000  | EDPCSR not implemented. |
| 0010  | EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state. |

Accessing the EDDEV1D1:
EDDEV1D1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC4</td>
</tr>
</tbody>
</table>
H9.2.21  EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

**Purpose**

Reserved for future descriptions of features of the debug implementation.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

EDDEVID2 is in the Debug power domain.

**Attributes**

EDDEVID2 is a 32-bit register.

**Field descriptions**

The EDDEVID2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Reserved, RES0.

**Accessing the EDDEVID2:**

EDDEVID2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC0</td>
</tr>
</tbody>
</table>
H9.2.22  EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

**Purpose**
Indicates to a debugger that this component is part of a PEs debug logic.

**Usage constraints**
This register is accessible as follows:

**Configurations**
EDDEVTYPE is in the Debug power domain.
EDDEVTYPE is optional to implement in the external register interface.

**Attributes**
EDDEVTYPE is a 32-bit register.

**Field descriptions**
The EDDEVTYPE bit assignments are:

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>8</td>
<td>7</td>
<td>4</td>
<td>0</td>
</tr>
<tr>
<td>RES0</td>
<td>SUB</td>
<td>MAJOR</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**
Reserved, RES0.

**SUB, bits [7:4]**
Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**
Major type. Must read as 0x5 to indicate this is a debug logic component.

**Accessing the EDDEVTYPE:**
EDDEVTYPE can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFCC</td>
</tr>
</tbody>
</table>
H9.2.23   EDDFR, External Debug Feature Register

The EDDFR characteristics are:

**Purpose**

Provides top level information about the debug system in AArch64.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RO</td>
</tr>
</tbody>
</table>

Debuggers must use EDDEVARCH to determine the Debug architecture version.

**Configurations**

External register EDDFR is architecturally mapped to AArch64 System register ID_AA64DFR0_EL1.

EDDFR is in the Debug power domain.

**Attributes**

EDDFR is a 64-bit register.

**Field descriptions**

The EDDFR bit assignments are:

```
+----+----+----+----+----+----+----+----+----+----+
| 63 | 32 | 26 | 19 | 12 |  8 |  7 |  4 |  3 |  0 |
+----+----+----+----+----+----+----+----+----+----+
| RES0| CTX_CMPs| RES0| WRPs| RES0| BRPs| PMUVer| TraceVer| UNKNOWN |
+----+----+----+----+----+----+----+----+----+----+
```

**Bits [63:32]**

Reserved, RES0.

**CTX_CMPs, bits [31:28]**

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

**Bits [27:24]**

Reserved, RES0.

**WRPs, bits [23:20]**

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

**Bits [19:16]**

Reserved, RES0.

**BRPs, bits [15:12]**

Number of breakpoints, minus 1. The value of 0b0000 is reserved.
PMUVer, bits [11:8]

Performance Monitors extension version. Indicates whether system register interface to Performance Monitors extension is implemented. Defined values are:

- **0000**: Performance Monitors extension system registers not implemented.
- **0001**: Performance Monitors extension system registers implemented, PMUv3.
- **1111**: IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported.

All other values are reserved.

TraceVer, bits [7:4]

Trace support. Indicates whether system register interface to a trace macrocell is implemented. Defined values are:

- **0000**: Trace macrocell system registers not implemented.
- **0001**: Trace macrocell system registers implemented.

All other values are reserved.

A value of 0000 only indicates that no system register interface to a trace macrocell is implemented. A trace macrocell might nevertheless be implemented without a system register interface.

UNKNOWN, bits [3:0]

Reserved, UNKNOWN.

Accessing the EDDFR:

EDDFR[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD28</td>
</tr>
</tbody>
</table>

EDDFR[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD2C</td>
</tr>
</tbody>
</table>
H9 External Debug Register Descriptions
H9.2 Debug registers

H9.2.24    EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

**Purpose**

Controls exception catch debug events.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register EDECCR is architecturally mapped to AArch64 System register OSECCR_EL1.
External register EDECCR is architecturally mapped to AArch32 System register DBGOSECCR.
EDECCR is in the Core power domain.

**Attributes**

EDECCR is a 32-bit register.

**Field descriptions**

The EDECCR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>NSE</td>
<td>SE</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**NSE, bits [7:4]**

Coarse-grained Non-secure exception catch. Possible values of this field are:

- 0000 Exception catch debug event disabled for Non-secure Exception levels.
- 0010 Exception catch debug event enabled for Non-secure EL1.
- 0100 Exception catch debug event enabled for Non-secure EL2.
- 0110 Exception catch debug event enabled for Non-secure EL1 and EL2.

All other values are reserved. Bits [7,4] are reserved, RES0.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Cold reset.

**SE, bits [3:0]**

Coarse-grained Secure exception catch. Possible values of this field are:

- 0000 Exception catch debug event disabled for Secure Exception levels.
- 0010 Exception catch debug event enabled for Secure EL1.
- 1000 Exception catch debug event enabled for Secure EL3.
- 1010 Exception catch debug event enabled for Secure EL1 and EL3.
All other values are reserved. Bits [2,0] are reserved. RES0. Ignored if ExternalSecureInvasiveDebugEnabled() == FALSE.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Cold reset.

**Accessing the EDECCR:**

EDECCR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x098</td>
</tr>
</tbody>
</table>
H9.2.25  EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose
Controls Halting debug events.

Usage constraints
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations
EDECR is in the Debug power domain.

Attributes
EDECR is a 32-bit register.

Field descriptions
The EDECR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>32</th>
<th>31</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:3]
Reserved, RES0.

SS, bit [2]
Halting step enable. Possible values of this field are:
0  Halting step debug event disabled.
1  Halting step debug event enabled.
If the value of EDECR.SS is changed when the PE is in Non-debug state, the resulting value of EDECR.SS is UNKNOWN.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on External debug reset.

RCE, bit [1]
Reset catch enable. Possible values of this field are:
0  Reset catch debug event disabled.
1  Reset catch debug event enabled.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on External debug reset.
OSUCE, bit [0]

OS unlock catch enabled. Possible values of this field are:

0   OS unlock catch debug event disabled.
1   OS unlock catch debug event enabled.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on External debug reset.

Accessing the EDECR:

EDECR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x024</td>
</tr>
</tbody>
</table>
H9.2.26  EDESR, External Debug Event Status Register

The EDESR characteristics are:

**Purpose**

Indicates the status of internally pending Halting debug events.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is constrained unpredictable whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it may become pending again when the Core is powered back on and Cold reset.

**Configurations**

EDESR is in the Core power domain.

**Attributes**

EDESR is a 32-bit register.

**Field descriptions**

The EDESR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:3</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>
| 2    | SS, bit [2] Halting step debug event pending. Possible values of this field are:  
| 0    | Reading this means that a Halting step debug event is not pending. Writing this means no action.  
| 1    | Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.  
|      | When this register has an architecturally-defined reset value, this field resets to the value of EDECR.SS.  
|      | This field resets to its defined reset value on Warm reset.  |
| 1    | RC, bit [1] Reset catch debug event pending. Possible values of this field are:  
| 0    | Reading this means that a Reset catch debug event is not pending. Writing this means no action.  |
Reading this means that a Reset catch debug event is pending. Writing this clears the pending Reset catch debug event.

When this register has an architecturally-defined reset value, this field resets to the value of EDECR.RCE.

This field resets to its defined reset value on Warm reset.

**OSUC, bit [0]**

OS unlock debug event pending. Possible values of this field are:

0  Reading this means that an OS unlock catch debug event is not pending. Writing this means no action.

1  Reading this means that an OS unlock catch debug event is pending. Writing this clears the pending OS unlock catch debug event.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**Accessing the EDESR:**

EDESR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x020</td>
</tr>
</tbody>
</table>
H9.2.27 EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations

It is IMPLEMENTATION DEFINED whether EDITCTRL is in the Core power domain or in the Debug power domain.

EDITCTRL is optional to implement in the external register interface.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions

The EDITCTRL bit assignments are:

```
31 1 0
| RES0 |

IME
```

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0 Normal operation.
1 Integration mode enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on IMPLEMENTATION DEFINED reset.
## Accessing the EDITCTRL:

EDITCTRL can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF00</td>
</tr>
</tbody>
</table>
**H9.2.28 EDITR, External Debug Instruction Transfer Register**

The EDITR characteristics are:

**Purpose**

Used in Debug state for passing instructions to the PE for execution.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>WI</td>
<td>WO</td>
</tr>
</tbody>
</table>

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

**Configurations**

EDITR is in the Core power domain.

**Attributes**

EDITR is a 32-bit register.

**Field descriptions**

The EDITR bit assignments are:

**When in AArch32 state:**

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>T32Second</td>
<td>T32First</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

T32Second, bits [31:16]
Second halfword of the T32 instruction to be executed on the PE.

T32First, bits [15:0]
First halfword of the T32 instruction to be executed on the PE.

**When in AArch64 state:**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>A64 instruction to be executed on the PE</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:0]
A64 instruction to be executed on the PE.
Accessing the EDITR:

EDITR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x084</td>
</tr>
</tbody>
</table>
H9.2.29  EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Default</th>
<th>WO</th>
</tr>
</thead>
</table>

Configurations

EDLAR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.

EDLAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

The EDLAR bit assignments are:

<table>
<thead>
<tr>
<th>KEY, bits [31:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
</tr>
<tr>
<td>30</td>
</tr>
<tr>
<td>29</td>
</tr>
<tr>
<td>28</td>
</tr>
<tr>
<td>27</td>
</tr>
<tr>
<td>26</td>
</tr>
<tr>
<td>25</td>
</tr>
<tr>
<td>24</td>
</tr>
<tr>
<td>23</td>
</tr>
<tr>
<td>22</td>
</tr>
<tr>
<td>21</td>
</tr>
<tr>
<td>20</td>
</tr>
<tr>
<td>19</td>
</tr>
<tr>
<td>18</td>
</tr>
<tr>
<td>17</td>
</tr>
<tr>
<td>16</td>
</tr>
<tr>
<td>15</td>
</tr>
<tr>
<td>14</td>
</tr>
<tr>
<td>13</td>
</tr>
<tr>
<td>12</td>
</tr>
<tr>
<td>11</td>
</tr>
<tr>
<td>10</td>
</tr>
<tr>
<td>9</td>
</tr>
<tr>
<td>8</td>
</tr>
<tr>
<td>7</td>
</tr>
<tr>
<td>6</td>
</tr>
<tr>
<td>5</td>
</tr>
<tr>
<td>4</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Accessing the EDLAR:

EDLAR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF80</td>
</tr>
</tbody>
</table>
H9.2.30 EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

**Purpose**

Indicates the current status of the software lock for external debug registers.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Configurations**

EDLSR is in the Debug power domain.

If optional memory-mapped access to the external debug interface is supported then an optional software lock can be implemented as part of CoreSight compliance.

EDLSR is RAZ if the software lock is not implemented and is RAZ for other accesses to the external debug interface.

The software lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

**Attributes**

EDLSR is a 32-bit register.

**Field descriptions**

The EDLSR bit assignments are:

31

32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

RES0

SLI SLK nTT

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

Software lock status for this component. For an access to LSR that is not a memory-mapped access, or when the software lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:

0 Lock clear. Writes are permitted to this component's registers.
1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

When this register has an architecturally-defined reset value, this field resets to 1.

This field resets to its defined reset value on External debug reset.

SLI, bit [0]

Software lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

0 Software lock not implemented or not memory-mapped access.
1 Software lock implemented and memory-mapped access.

Accessing the EDLSR:

EDLSR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF84</td>
</tr>
</tbody>
</table>
H9.2.31  EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

EDPCSR is in the Core power domain.

EDPCSR is optional to implement in the external register interface.

**Attributes**

EDPCSR is a 64-bit register.

**Field descriptions**

The EDPCSR bit assignments are:

```
0 31 32 63
PC Sample high word, EDPCSRhi
```

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled PC.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

```
0 31 32
PC Sample low word, EDPCSRlo
```

PC Sample low word, EDPCSRlo. Bits [31:0] of the sampled instruction address value. Reading EDPCSRlo has the side-effect of updating EDCIDS.R, EDVIDSR, and EDPCSRhi. However:

- If the PE is in Debug state, or Sample-based profiling is prohibited, EDPCSRlo reads as 0xFFFFFFFF and EDCIDS.R, EDVIDSR, and EDPCSRhi become UNKNOWN.
- If the PE is in Reset state, the sampled value is unknown and EDCIDS.R, EDVIDSR and EDPCSRhi become UNKNOWN.
- If no instruction has been retired since the PE left Reset state, Debug state, or a state where Non-invasive debug is not permitted, the sampled value is UNKNOWN and EDCIDS.R, EDVIDSR, and EDPCSRhi become UNKNOWN.
- For a read of EDPCSRlo from the memory-mapped interface, if EDLSR.SLK == 1, meaning the Software Lock is locked, then the access has no side-effects. That is, EDCIDS.R, EDVIDSR, and EDPCSRhi are unchanged.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.
Accessing the EDPCSR:

EDPCSR[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A0</td>
</tr>
</tbody>
</table>

EDPCSR[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0AC</td>
</tr>
</tbody>
</table>
H9.2.32 EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

**Purpose**

Provides additional information about implemented PE features in AArch64.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

External register EDPFR is architecturally mapped to AArch64 System register ID_AA64PFR0_EL1.

EDPFR is in the Debug power domain.

**Attributes**

EDPFR is a 64-bit register.

**Field descriptions**

The EDPFR bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>28</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>GIC</td>
<td>AdvSIMD</td>
<td>FP</td>
<td>EL3</td>
<td>EL2</td>
<td>EL1</td>
<td>EL0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:28]**

Reserved, RES0.

**GIC, bits [27:24]**

System register GIC interface. Defined values are:

- 0000  No System register interface to the GIC is supported.
- 0001  System register interface to the GIC CPU interface is supported.

All other values are reserved.

**AdvSIMD, bits [23:20]**

Advanced SIMD. Defined values are:

- 0000  Advanced SIMD is implemented.
- 1111  Advanced SIMD is not implemented.

All other values are reserved.

**FP, bits [19:16]**

Floating-point. Defined values are:

- 0000  Floating-point is implemented.
- 1111  Floating-point is not implemented.

All other values are reserved.
EL3, bits [15:12]
EL3 Exception level handling. Defined values are:
0000  EL3 is not implemented.
0001  EL3 can be executed in AArch64 state only.
0010  EL3 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

EL2, bits [11:8]
EL2 Exception level handling. Defined values are:
0000  EL2 is not implemented.
0001  EL2 can be executed in AArch64 state only.
0010  EL2 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

EL1, bits [7:4]
EL1 Exception level handling. Defined values are:
0001  EL1 can be executed in AArch64 state only.
0010  EL1 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

EL0, bits [3:0]
EL0 Exception level handling. Defined values are:
0001  EL0 can be executed in AArch64 state only.
0010  EL0 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

Accessing the EDPFR:

EDPFR[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x20</td>
</tr>
</tbody>
</table>

EDPFR[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x24</td>
</tr>
</tbody>
</table>
H9.2.33   EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

EDPIDR0 is in the Debug power domain.

EDPIDR0 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR0 is a 32-bit register.

**Field descriptions**

The EDPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PART_0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

**Accessing the EDPIDR0:**

EDPIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE0</td>
</tr>
</tbody>
</table>
H9.2.34  **EDPIDR1, External Debug Peripheral Identification Register 1**

The EDPIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

EDPIDR1 is in the Debug power domain.

EDPIDR1 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR1 is a 32-bit register.

**Field descriptions**

The EDPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>DES_0</td>
<td>PART_1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is 0b1011.

**PART_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the EDPIDR1:**

EDPIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE4</td>
</tr>
</tbody>
</table>
### H9.2.35 EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

#### Configurations

EDPIDR2 is in the Debug power domain.

EDPIDR2 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

#### Attributes

EDPIDR2 is a 32-bit register.

#### Field descriptions

The EDPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td>REVISION</td>
<td>DES_1</td>
<td>JEDEC</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is 0b011.

#### Accessing the EDPIDR2:

EDPIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE8</td>
</tr>
</tbody>
</table>

H9.2.36  **EDPIDR3, External Debug Peripheral Identification Register 3**

The EDPIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

EDPIDR3 is in the Debug power domain.

EDPIDR3 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR3 is a 32-bit register.

**Field descriptions**

The EDPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td>REVAND</td>
<td>CMOD</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the EDPIDR3:**

EDPIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFEC</td>
</tr>
</tbody>
</table>
H9.2.37 EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

**Purpose**

Provides information to identify an external debug component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

EDPIDR4 is in the Debug power domain.

EDPIDR4 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR4 is a 32-bit register.

**Field descriptions**

The EDPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SIZE</td>
<td>DES_2</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is 0b0100.

**Accessing the EDPIDR4:**

EDPIDR4 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF00</td>
</tr>
</tbody>
</table>
H9.2.38   EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

**Purpose**

Controls the PE functionality related to powerup, reset, and powerdown.

**Usage constraints**

Accessing this register depends on which field is being accessed; see the register field descriptions for the states that they are accessible in.

**Configurations**

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

Bit [0] of this register is mapped to DBGPRCR.CORENPDRQ, bit [0] of the AArch32 view of this register.

Bit [0] of this register is mapped to DBGPRCR_EL1.CORENPDRQ, bit [0] of the AArch64 view of this register.

The other bits in these registers are not mapped to each other.

**Attributes**

EDPRCR is a 32-bit register.

**Field descriptions**

The EDPRCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>COREPURQ, bit [3]</td>
</tr>
<tr>
<td>2</td>
<td>CORENPDRQ</td>
</tr>
<tr>
<td>1</td>
<td>CWRR</td>
</tr>
<tr>
<td>0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**COREPURQ, bit [3]**

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain. The actions on writing to this bit are:

0  Do not request power up of the Core power domain.
1  Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRRUPREQ signal.

This bit can be read and written when the Core power domain is powered off.

The power controller must not allow the Core power domain to switch off while this bit is one.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on External debug reset.
This field is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-5114. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**Bit [2]**

Reserved, RES0.

**CWRR, bit [1]**

Warm reset request. Write only bit that reads as zero. The actions on writing to this bit are:

- 0 No action.
- 1 Request Warm reset.

The PE ignores writes to this bit if any of the following are the case:

- `ExternalInvasiveDebugEnabled()` == FALSE, EL3 is not implemented, and the implemented Security state is Non-Secure state.
- `ExternalSecureInvasiveDebugEnabled()` == FALSE and one of the following is true:
  - EL3 is implemented.
  - The implemented Security state is Secure state.
- The Core power domain is either completely off or in a low-power state where the Core power domain registers cannot be accessed.
- `DoubleLockStatus()` == TRUE (OS Double Lock is set).
- `OSLSR.OSLK` == 1 (OS lock is locked).

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

When a write to this bit initiates a Warm Reset, the extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

**Note**

Although the ARM architecture permits the first option from the above list, ARM recommends that either of the other options is implemented.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>WI</td>
<td>WI</td>
<td>WI</td>
<td>WI</td>
<td>WO</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers* on page H8-5114. The priority at which each condition applies is from highest priority on the left to lowest on the right.
CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown. Possible values of this bit are:

0  On a powerdown request, the system powers down the Core power domain.
1  On a powerdown request, the system emulates powerdown of the Core power domain.
   In this emulation mode the Core power domain is not actually powered down.

This bit is UNKNOWN, and the PE ignores writes to this bit if any of the following are the case:
- The Core power domain is either completely off or in a low-power state where the Core power domain registers cannot be accessed.
- DoubleLockStatus() == TRUE (OS Double Lock is set).
- OSLSR.OSLK == 1 (OS lock is locked).

When this register has an architecturally-defined reset value, this field resets to the value of EDPRCR.COREPURQ.

This field resets to its defined reset value on Cold reset.

This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>WI</td>
<td>WI</td>
<td>WI</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in Access permissions for the External debug interface registers on page H8-5114. The priority at which each condition applies is from highest priority on the left to lowest on the right.

Accessing the EDPRCR:

EDPRCR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x310</td>
</tr>
</tbody>
</table>
H9.2.39 EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

**Purpose**

Holds information about the reset and powerdown state of the PE.

**Usage constraints**

Accessing this register depends on which field is being accessed; see the register field descriptions for the states that they are accessible in.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If EDPRSR.DLK == 0, then:
  - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

**Configurations**

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

**Attributes**

EDPRSR is a 32-bit register.

**Field descriptions**

The EDPRSR bit assignments are:

<p>| | | | | | | | | | | | | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

</tbody>
</table>

**Bits [31:12]**

Reserved, RES0.

**SDR, bit [11]**

Sticky debug restart. Set to 1 when the PE exits Debug state.
This bit is **UNKNOWN** on reads if any of the following are true:

- DoubleLockStatus() == TRUE (EDPSR.DLK == 1). The OS double-lock is locked.
- EDPSR.R == 1. The PE is in Reset state.
- CorePoweredUp() == FALSE (EDPSR.PU == 0). The Core power domain is powered down.

Otherwise permitted values are:

- 0: The PE has not restarted since EDPSR was last read.
- 1: The PE has restarted since EDPSR was last read.

--- **Note** ---

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is **UNKNOWN** on Warm reset, meaning a debugger must also use the SR bit to infer the PE has left Debug state in this case.

If DoubleLockStatus() == FALSE then following a read of EDPSR, this bit clears to 0. Otherwise it is **CONSTRAINED UNPREDICTABLE** whether or not this clearing occurs.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNK</td>
<td>UNK</td>
<td>RO</td>
<td>RC</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers on page H8-5114*. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**SPMAD, bit [10]**

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

This bit is **UNKNOWN** on reads if any of EDPSR.{DLK, OSLK, R} is 1, or EDPSR.PU is 0.

Otherwise permitted values are:

- 0: No accesses to the external Performance Monitors registers have failed since EDPSR was last read.
- 1: At least one access to the external Performance Monitors registers has failed since EDPSR was last read.

If DoubleLockStatus() == FALSE then following a read of EDPSR, this bit clears to 0. Otherwise it is **CONSTRAINED UNPREDICTABLE** whether or not this clearing occurs.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.

This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNK</td>
<td>UNK</td>
<td>RO</td>
<td>RC</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in *Access permissions for the External debug interface registers on page H8-5114*. The priority at which each condition applies is from highest priority on the left to lowest on the right.
EPMAD, bit [9]

External Performance Monitors access disable status.

This bit is UNKNOWN on reads if any of EDPRSR.{DLK, OSLK, R} is 1, or EDPRSR.PU is 0. Otherwise permitted values are:

0  
External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.

1  
External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.

If external performance monitors access is not implemented, EPMAD is RAO.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNK</td>
<td>UNK</td>
<td>RO</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in Access permissions for the External debug interface registers on page H8-5114. The priority at which each condition applies is from highest priority on the left to lowest on the right.

SDAD, bit [8]

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

This bit is UNKNOWN on reads if any of the following are true:

- Either of EDPRSR.{DLK, R} is 1.
- EDPRSR.PU is 0.
- EDPRSR.OSLK is 1 and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == True.

Otherwise permitted values are:

0  
No accesses to the external debug registers have failed since EDPRSR was last read.

1  
At least one access to the external debug registers has failed since EDPRSR was last read.

If DoubleLockStatus() == FALSE then following a read of EDPRSR, this bit clears to 0. Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.

This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNK</td>
<td>UNK</td>
<td>RO</td>
<td>RC</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in Access permissions for the External debug interface registers on page H8-5114. The priority at which each condition applies is from highest priority on the left to lowest on the right.

EDAD, bit [7]

External debug access disable status.
This bit is **UNKNOWN** on reads if any of the following are true:

- Either of EDPRSR.{DLK, R} is 1.
- EDPRSR.PU is 0.
- EDPRSR.OSLK is 1 and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == True.

Otherwise permitted values are:

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>DLK</td>
<td>EDAD</td>
<td>Default</td>
</tr>
<tr>
<td>UNK</td>
<td>UNK</td>
<td>RAO</td>
<td>RAZ</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

**DLK, bit [6]**

OS Double Lock status bit. Returns the result of the pseudocode function DoubleLockStatus().

This bit is **UNKNOWN** on reads if EDPRSR.PU is 0.

Otherwise reads as zero if any of the following are true, that is when DoubleLockStatus() == FALSE:

- **OSDLR_EL1.DLK** == 0.
- **DBGPRCR_EL1.CORENPDRQ** == 1.
- The PE is in Debug state.

If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 0, EDPRSR.DLK reads as 1, and EDPRSR.SPD is **UNKNOWN**.
- EDPRSR.PU reads as 1, EDPRSR.DLK is **UNKNOWN**, and EDPRSR.SPD reads as 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally **UNKNOWN**.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>DLK</td>
<td>Default</td>
<td></td>
</tr>
<tr>
<td>UNK</td>
<td>RAO</td>
<td>RAZ</td>
<td></td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in **Access permissions for the External debug interface registers on page H8-5114**. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**OSLK, bit [5]**

OS lock status bit.

This bit is **UNKNOWN** on reads if either of EDPRSR.{DLK, R} is 1 or EDPRSR.PU is 0.

The meanings of the conditions in the table above are summarized in **Access permissions for the External debug interface registers on page H8-5114**. The priority at which each condition applies is from highest priority on the left to lowest on the right.
A read of this bit returns the value of OSLR_EL1.OSLK.
When this register has an architecturally-defined reset value, this field resets to a value that is
architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.
This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNK</td>
<td>UNK</td>
<td>RAO</td>
<td>RAZ</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in Access permissions for the
External debug interface registers on page H8-5114. The priority at which each condition applies
is from highest priority on the left to lowest on the right.

HALTED, bit [4]
Halted status bit.
This bit is UNKNOWN on reads if EDPRSR.PU is 0.
Otherwise permitted values are:
0   EDSR.STATUS is 0b000010 (PE in Non-debug state).
1   EDSR.STATUS is not 0b000010.
When this register has an architecturally-defined reset value, this field resets to a value that is
architecturally UNKNOWN.
This field resets to its defined reset value on Warm reset.
This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNK</td>
<td>RAZ</td>
<td>RO</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in Access permissions for the
External debug interface registers on page H8-5114. The priority at which each condition applies
is from highest priority on the left to lowest on the right.

SR, bit [3]
Sticky core reset status bit.
This bit is UNKNOWN on reads if EDPRSR.DLK is 1 or EDPRSR.PU is 0.
Otherwise permitted values are:
0   The non-debug logic of the PE is not in reset state and has not been reset since the last
time EDPRSR was read.
1   The non-debug logic of the PE is in reset state or has been reset since the last time
EDPRSR was read.
If DoubleLockStatus() == FALSE then following a read of EDPRSR, this bit clears to 0 if the
non-debug logic of the PE is not in reset state. Otherwise it is CONSTRAINED UNPREDICTABLE
whether or not this clearing occurs.
When this register has an architecturally-defined reset value, this field resets to 1.
This field resets to its defined reset value on Warm reset.
This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNK</td>
<td>UNK</td>
<td>RO</td>
<td>RC</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in Access permissions for the External debug interface registers on page H8-5114. The priority at which each condition applies is from highest priority on the left to lowest on the right.

R, bit [2]

Core reset status bit.

This bit is UNKNOWN on reads if either EDPRSR.DLK is 1 or EDPRSR.PU is 0. Otherwise permitted values are:

0 The non-debug logic of the PE is not in reset state.
1 The non-debug logic of the PE is in reset state.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

This field is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNK</td>
<td>UNK</td>
<td>RO</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in Access permissions for the External debug interface registers on page H8-5114. The priority at which each condition applies is from highest priority on the left to lowest on the right.

SPD, bit [1]

Sticky core powerdown status bit.

This bit is UNKNOWN on reads if both EDPRSR.DLK and EDPRSR.PU are 1. Otherwise, permitted values are:

0 If the Core power domain is in a low-power or powerdown state (EDPRSR.PU is 0), it is not known whether the state of the debug registers in the Core power domain is lost. If the Core power domain is in a powerup state (EDPRSR.PU is 1), the state of the debug registers in the Core power domain has not been lost.
1 The state of the debug registers in the Core power domain is lost.

If DoubleLockStatus() == FALSE and the PE is not in the powerdown state, then following a read of EDPRSR, this bit clears to 0. Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If DoubleLockStatus() == TRUE and the PE is not in the powerdown state, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

There are two logical states for the Core power domain when EDPRSR.PU is 0:

Retention The state of the debug registers, including EDPRSR.SPD, in the Core power domain is preserved, and restored on leaving retention state.
Powerdown The state of the debug registers in the Core power domain is lost, and a Cold reset is asserted on leaving powerdown state.
In these states, EDPRSR.SPD is not cleared following a read of EDPRSR, and it is IMPLEMENTATION DEFINED whether:

- EDPRSR.SPD shows whether the state of the debug registers in the Core power domain has been lost since the last time EDPRSR was read when the Core power domain was powered up. That is:
  - While in the powerdown state, EDPRSR.SPD is RAO, as the state of the debug registers has been lost.
  - While in the retention state, the value of EDPRSR.EPD is unchanging and shows whether the state of the debug registers was lost before entering retention state. This does not allow EDPRSR.SPD to be fixed RAO in the retention state, as the state of the debug registers in the Core power domain is not lost by entering this state.
EDPRSR.SPD can read as either 0 or 1.

- EDPRSR.SPD reads-as-zero, and:
  - On leaving the powerdown state, EDPRSR.SPD is set to 1, as the state of the debug registers has been lost.
  - On leaving the retention state, EDPRSR.SPD reverts to the value it had on entering retention state.

ARM recommends that an implementation make EDPRSR.SPD fixed RAO when in the powerdown state, particularly if it does not support a low-power retention state.

When this register has an architecturally-defined reset value, this field resets to 1.
This field resets to its defined reset value on Cold reset.
This field is accessible as shown below:

<table>
<thead>
<tr>
<th></th>
<th>Off</th>
<th>DLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RO</td>
<td>UNK</td>
<td>RO</td>
<td>RC</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in Access permissions for the External debug interface registers on page H8-5114. The priority at which each condition applies is from highest priority on the left to lowest on the right.

**PU, bit [0]**

Core powerup status bit. Indicates whether the Core power domain debug registers can be accessed. The value of EDPRSR.PU is IMPLEMENTATION DEFINED when the OS double-lock is locked. See the description of DLK for more information.

Otherwise, permitted values are:

0 Core is in a low-power or powerdown state where the debug registers cannot be accessed.

1 Core is in a powerup state where the debug registers can be accessed.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.
This field is accessible as shown below:

<table>
<thead>
<tr>
<th></th>
<th>Off</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RAZ</td>
<td>RAO</td>
</tr>
</tbody>
</table>

The meanings of the conditions in the table above are summarized in Access permissions for the External debug interface registers on page H8-5114. The priority at which each condition applies is from highest priority on the left to lowest on the right.
Accessing the EDPRSR:

EDPRSR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x314</td>
</tr>
</tbody>
</table>
H9.2.40 EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

**Purpose**
This register is used to allow imprecise entry to Debug state and clear sticky bits in EDSCR.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>WI</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Configurations**
EDRCR is in the Core power domain.

**Attributes**
EDRCR is a 32-bit register.

**Field descriptions**
The EDRCR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:5]</th>
<th>RES0</th>
<th>CSE</th>
<th>CSPA</th>
<th>CBRRQ</th>
</tr>
</thead>
</table>

**Reserved, RES0.**

**CBRRQ, bit [4]**
Allow imprecise entry to Debug state. The actions on writing to this bit are:
- **0** No action.
- **1** Allow imprecise entry to Debug state, for example by canceling pending bus accesses.

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

**CSPA, bit [3]**
Clear Sticky Pipeline Advance. This bit is used to clear the EDSCR.PipeAdv bit to 0. The actions on writing to this bit are:
- **0** No action.
- **1** Clear the EDSCR.PipeAdv bit to 0.
CSE, bit [2]

Clear Sticky Error. Used to clear the EDSCR cumulative error bits to 0. The actions on writing to this bit are:

0 No action.
1 Clear the EDSCR.{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR.ITO bit, to 0.

Bits [1:0]

Reserved, RES0.

Accessing the EDRCR:

EDRCR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x090</td>
</tr>
</tbody>
</table>
H9.2.41   EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations

EDSCR is in the Core power domain.

Attributes

EDSCR is a 32-bit register.

Field descriptions

The EDSCR bit assignments are:

<table>

<td></td>
</tr>
<tr>
<td>STATUS, bit [1]</td>
<td></td>
</tr>
<tr>
<td>STATUS, bit [0]</td>
<td></td>
</tr>
</tbody>
</table>
This field resets to its defined reset value on Cold reset.

**ITO, bit [28]**

EDITR overrun. This bit is RO.

If the PE is not in Debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.

**RXO, bit [27]**

DTRRX overrun. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.

**TXU, bit [26]**

DTRTX underrun. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.

**PipeAdv, bit [25]**

Pipeline advance. Read-only. Set to 1 every time the PE pipeline retires one or more instructions.

Cleared to 0 by a write to EDRCR.CSPA.

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

**ITE, bit [24]**

ITR empty. This bit is RO.

If the PE is not in Debug state, this bit is UNKNOWN. It is always valid in Debug state.

**INTdis, bits [23:22]**

Interrupt disable. Disables taking interrupts (including virtual interrupts and System Error interrupts) in Non-Debug state.

If external invasive debug is disabled, the value of this field is ignored.

If external invasive debug is enabled, the possible values of this field are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Do not disable interrupts</td>
</tr>
<tr>
<td>01</td>
<td>Disable interrupts taken to Non-secure EL1.</td>
</tr>
<tr>
<td>10</td>
<td>Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If external secure invasive debug is enabled, also disable interrupts taken to Secure EL1.</td>
</tr>
<tr>
<td>11</td>
<td>Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If external secure invasive debug is enabled, also disable all other interrupts.</td>
</tr>
</tbody>
</table>

The value of INTdis does not affect whether an interrupt is a WFI wake-up event, but can mask an interrupt as a WFE wake-up event.

If EL3 and EL2 are not implemented, INTdis[0] is RO and reads the same value as INTdis[1], meaning only the values 00 and 11 can be selected.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.

**TDA, bit [21]**

Trap debug registers accesses.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Accesses to debug registers are not trapped to Debug state.</td>
</tr>
<tr>
<td>1</td>
<td>Accesses to debug registers are trapped to Debug state, if OSLSR.OSLK is also 0.</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Cold reset.
MA, bit [20]
Memory access mode. Controls use of memory-access mode for accessing EDITR and the DCC.
This bit is ignored if in Non-debug state and set to zero on entry to Debug state.
Possible values of this field are:
0 Normal access mode.
1 Memory access mode.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Cold reset.

Bit [19]
Reserved, RES0.

NS, bit [18]
Non-secure status. Read-only. When in Debug state, gives the current Security state:
0 Secure state, IsSecure() == TRUE.
1 Non-secure state, IsSecure() == FALSE.
In Non-debug state, this bit is UNKNOWN.

Bit [17]
Reserved, RES0.

SDD, bit [16]
Secure debug disabled. This bit is RO.
On entry to Debug state:
• If entering in Secure state, SDD is set to 0.
• If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().
In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.
In Non-debug state:
• SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization operation is required to guarantee their effect.
• This bit is unaffected by the Security state of the PE.
If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Bit [15]
Reserved, RES0.

HDE, bit [14]
Halting debug enable.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Cold reset.
**RW, bits [13:10]**

Exception level Execution state status. Read-only. In Debug state, each bit gives the current Execution state of each EL:

<table>
<thead>
<tr>
<th>RW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1111</td>
<td>All Exception levels are using AArch64.</td>
</tr>
<tr>
<td>1110</td>
<td>EL0 is using AArch32. All other Exception levels are using AArch64.</td>
</tr>
<tr>
<td>110x</td>
<td>EL0 and EL1 are using AArch32. All other Exception levels are using AArch64. Never seen if EL2 is not implemented in the current Security state.</td>
</tr>
<tr>
<td>10xx</td>
<td>EL0, EL1, and, if implemented in the current Security state, EL2 are using AArch32. All other Exception levels are using AArch64.</td>
</tr>
<tr>
<td>0xxx</td>
<td>All Exception levels are using AArch32.</td>
</tr>
</tbody>
</table>

However:
- The value of 1110 is only permitted at EL0.
- The values 110x are not permitted if either:
  - EL2 is not implemented.
  - EL3 is implemented and SCR_EL3.NS/SCR.NS == 0.
- The values 10xx are not permitted if EL3 is not implemented.

In Non-debug state, this field is RAO.

**EL, bits [9:8]**

Exception level. Read-only. In Debug state, this gives the current EL of the PE.
In Non-debug state, this field is RAZ.

**A, bit [7]**

System Error interrupt pending. Read-only. In Debug state, indicates whether a SError interrupt is pending:
- If `HCR_EL2.{AMO, TGE} = {1, 0}` and in Non-secure EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

| 0 | No SError interrupt pending. |
| 1 | SError interrupt pending. |

A debugger can read EDSCR to check whether a SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted. UNKNOWN in Non-debug state.

**ERR, bit [6]**

Cumulative error flag. This field is RO. It is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.
When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on Cold reset.

**STATUS, bits [5:0]**

Debug status flags. This field is RO.
The possible values of this field are:
- 000010 PE is in Non-debug state.
00001  PE is restarting (exiting Debug state).
00011  Breakpoint.
010011 External debug request.
011011 Halting step, normal.
011111 Halting step, exclusive.
100011 OS unlock catch.
100111 Reset catch.
101011 Watchpoint.
101111 HLT instruction.
110011 Software access to debug register.
110111 Exception catch.
111011 Halting step, no syndrome.
All other values of STATUS are reserved.

Accessing the EDSCR:

EDSCR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x088</td>
</tr>
</tbody>
</table>
H9.2.42  EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading EDPCSR.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

EDVIDSR is in the Core power domain.

Attributes

EDVIDSR is a 32-bit register.

Field descriptions

The EDVIDSR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>NS</td>
<td>RES0</td>
<td>VMID</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

E2, bit [30]

Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2. If EDVIDSR.NS == 0, this bit is 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

E3, bit [29]

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with AArch64 EL3. If EDVIDSR.NS == 1 or the PE was in AArch32 state when EDPCSR was read, this bit is 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.
**HV, bit [28]**

EDPCSR high half valid. Indicates whether bits [63:32] of the most recent EDPCSR sample are valid. If EDVIDSR.HV == 0, the value of EDPCSR[63:32] is RAZ.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [27:8]**

Reserved, RES0.

**VMID, bits [7:0]**

VMID sample. The value of VTTBR_EL2.VMID associated with the most recent EDPCSR sample. If EDVIDSR.NS == 0 or EDVIDSR.E2 == 1, this field is RAZ.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Accessing the EDVIDSR:**

EDVIDSR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x0A8</td>
</tr>
</tbody>
</table>
### EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

#### Purpose

Contains the virtual data address being accessed when a watchpoint debug event was triggered.

#### Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
</tr>
</tbody>
</table>

#### Configurations

EDWAR is in the Core power domain.

#### Attributes

EDWAR is a 64-bit register.

#### Field descriptions

The EDWAR bit assignments are:

**Bits [63:0]**

Watchpoint address. The virtual data address being accessed when a watchpoint debug event was triggered and caused entry to Debug state.

UNKNOWN if the PE is not in Debug state, or if Debug state was entered other than for a watchpoint debug event.

The address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

#### Accessing the EDWAR:

EDWAR[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x030</td>
</tr>
</tbody>
</table>

EDWAR[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x034</td>
</tr>
</tbody>
</table>
H9.2.44 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

External register MIDR_EL1 is architecturally mapped to AArch64 System register MIDR_EL1.

External register MIDR_EL1 is architecturally mapped to AArch32 System register MIDR.

MIDR_EL1 is in the Debug power domain.

**Attributes**

MIDR_EL1 is a 32-bit register.

**Field descriptions**

The MIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>24 23</th>
<th>20 19</th>
<th>16 15</th>
<th>4 3 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementer</td>
<td>Variant</td>
<td>PartNum</td>
<td>Revision</td>
<td></td>
</tr>
</tbody>
</table>

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td>ARM Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>B</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>C</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>D</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x49</td>
<td>I</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x4D</td>
<td>M</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>N</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>P</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
</tbody>
</table>
ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

The permitted values of this field are:

- **0001** ARMv4
- **0010** ARMv4T
- **0011** ARMv5 (obsolete)
- **0100** ARMv5T
- **0101** ARMv5TE
- **0110** ARMv5TEJ
- **0111** ARMv6
- **1111** Architectural features are individually identified in the ID_* registers, see Identification registers, functional group on page G4-4232.

All other values are reserved.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

**Accessing the MIDR_EL1:**

MIDR_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x000</td>
</tr>
</tbody>
</table>
H9.2.45 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS lock.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>WI</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Configurations**

External register OSLAR_EL1 is architecturally mapped to AArch64 System register
OSLAR_EL1.

External register OSLAR_EL1 is architecturally mapped to AArch32 System register
DBGOSLAR.

OSLAR_EL1 is in the Core power domain.

**Attributes**

OSLAR_EL1 is a 32-bit register.

**Field descriptions**

The OSLAR_EL1 bit assignments are:

```
31 1 0

RES0

OSLK
```

**Bits [31:1]**

Reserved, RES0.

**OSLK, bit [0]**

On writes to OSLAR_EL1, bit[0] is copied to the OS lock.

Use **EDPRS.OSLK** to check the current status of the lock.

**Accessing the OSLAR_EL1:**

OSLAR_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x300</td>
</tr>
</tbody>
</table>
H9.3 Cross-Trigger Interface registers

This section lists the Cross-Trigger Interface registers.
H9.3.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

**Purpose**
Provides a control for external multiplexing of additional triggers into the CTI.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**
ASICCTL is in the Debug power domain.

**Attributes**
ASICCTL is a 32-bit register.

**Field descriptions**
The ASICCTL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ASICCTL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**
Reserved, RES0.

**ASICCTL, bits [7:0]**
IMPLEMENTATION DEFINED ASIC control. Provides a control for external multiplexing of additional triggers into the CTI.

If external multiplexing of trigger signals is implemented then the number of multiplexed signals on each trigger must be reflected in CTIDEVID.EXTMUXNUM.

If CTIDEVID.EXTMUXNUM is zero, this field is RAZ.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED value, that might be UNKNOWN.

This field resets to its defined reset value on IMPLEMENTATION DEFINED reset.

**Accessing the ASICCTL:**
ASICCTL can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x144</td>
</tr>
</tbody>
</table>
H9.3.2 CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

**Purpose**
Clears bits of the Application Trigger register.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Configurations**
CTIAPPCLEAR is in the Debug power domain.

**Attributes**
CTIAPPCLEAR is a 32-bit register.

**Field descriptions**
The CTIAPPCLEAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPCLEAR&lt;x&gt;, bit [x]</td>
<td></td>
</tr>
</tbody>
</table>

**APPCLEAR<x>, bit [x], for x = 0 to 31**
Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No effect.</td>
</tr>
<tr>
<td>1</td>
<td>Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.</td>
</tr>
</tbody>
</table>

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPULSE.

**Accessing the CTIAPPCLEAR:**
CTIAPPCLEAR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x18</td>
</tr>
</tbody>
</table>
H9.3.3 CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

**Purpose**

Causes event pulses to be generated on ECT channels.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIAPPPULSE is in the Debug power domain.

**Attributes**

CTIAPPPULSE is a 32-bit register.

**Field descriptions**

The CTIAPPPULSE bit assignments are:

<table>
<thead>
<tr>
<th>APPPULSE&lt;x&gt;, bit [x]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

**APPPULSE<x>, bit [x], for x = 0 to 31**

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

<table>
<thead>
<tr>
<th></th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No effect.</td>
</tr>
<tr>
<td>1</td>
<td>Channel &lt;x&gt; event pulse generated for one clock period.</td>
</tr>
</tbody>
</table>

**Accessing the CTIAPPPULSE:**

CTIAPPPULSE can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x01C</td>
</tr>
</tbody>
</table>
H9.3.4 CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose
Sets bits of the Application Trigger register.

Usage constraints
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations
CTIAPPSET is in the Debug power domain.

Attributes
CTIAPPSET is a 32-bit register.

Field descriptions
The CTIAPPSET bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPSET&lt;(x)&gt;, bit [x]</td>
<td></td>
</tr>
</tbody>
</table>

APPSET<\(x\)>, bit [x], for \(x = 0 \text{ to } 31\)
Application trigger <\(x\)> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

0  Reading this means the application trigger is inactive. Writing this has no effect.
1  Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPULSE.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on External debug reset.

Accessing the CTIAPPSET:
CTIAPPSET can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x14</td>
</tr>
</tbody>
</table>
H9.3.5 CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. ARM recommends that this register is implemented.

CTIAUTHSTATUS. {SNID,SID} are RAZ, because the CTI does not itself provide Secure authentication.

**Attributes**

CTIAUTHSTATUS is a 32-bit register.

**Field descriptions**

The CTIAUTHSTATUS bit assignments are:

Bits [31:4]

Reserved, RES0.

NSNID, bits [3:2]

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as DBGAUTHSTATUS_EL1.SNID.

Otherwise, holds the same value as DBGAUTHSTATUS_EL1.NSNID.

NSID, bits [1:0]

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise, holds the same value as DBGAUTHSTATUS_EL1.NSID.
Accessing the CTIAUTHSTATUS:

CTIAUTHSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB8</td>
</tr>
</tbody>
</table>
H9.3.6 CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTICHINSTATUS is in the Debug power domain.

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions

The CTICHINSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIN&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

CHIN<\(n\)>, bit [\(n\)], for \(n = 0\) to \(31\)

- Input channel \(<n>\) status.
- Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.
- Possible values of this bit are:
  - 0: Input channel \(<n>\) is inactive.
  - 1: Input channel \(<n>\) is active.

Accessing the CTICHINSTATUS:

CTICHINSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x138</td>
</tr>
</tbody>
</table>
H9.3.7 CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

**Purpose**

Provides the status of the ECT channel outputs from the CTI.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTICHOUTSTATUS is in the Debug power domain.

**Attributes**

CTICHOUTSTATUS is a 32-bit register.

**Field descriptions**

The CTICHOUTSTATUS bit assignments are:

```
  31  0
  |   |
  |   CHOUT<n>, bit [n]
```

**CHOUT<n>, bit [n], for n = 0 to 31**

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Output channel &lt;n&gt; is inactive.</td>
</tr>
<tr>
<td>1</td>
<td>Output channel &lt;n&gt; is active.</td>
</tr>
</tbody>
</table>

**Accessing the CTICHOUTSTATUS:**

CTICHOUTSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x13C</td>
</tr>
</tbody>
</table>
H9.3.8 CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTICIDR0 is in the Debug power domain.

CTICIDR0 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR0 is a 32-bit register.

**Field descriptions**

The CTICIDR0 bit assignments are:

```
   Bit | Field          |
    31 | RES0           |
    23 | PRMBL_0        |
```

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as 0x0D.

**Accessing the CTICIDR0:**

CTICIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF0</td>
</tr>
</tbody>
</table>
H9.3.9  CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTICIDR1 is in the Debug power domain.
CTICIDR1 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**

CTICIDR1 is a 32-bit register.

**Field descriptions**

The CTICIDR1 bit assignments are:

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>8</td>
<td>7</td>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td></td>
<td>RES0</td>
<td>CLASS</td>
<td>PRMBL_1</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class. Reads as 0x9, debug component.

**PRMBL_1, bits [3:0]**

Preamble. RAZ.

**Accessing the CTICIDR1:**

CTICIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF4</td>
</tr>
</tbody>
</table>
H9.3.10 CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTICIDR2 is in the Debug power domain.
CTICIDR2 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions

The CTICIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PRMBL_2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble. Must read as 0x05.

Accessing the CTICIDR2:

CTICIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF8</td>
</tr>
</tbody>
</table>
H9.3.11  CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTICIDR3 is in the Debug power domain.

CTICIDR3 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR3 is a 32-bit register.

**Field descriptions**

The CTICIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>RES0</td>
<td>PRMBL_3</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble. Must read as 0xB1.

**Accessing the CTICIDR3:**

CTICIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFFC</td>
</tr>
</tbody>
</table>
H9.3.12  CTICLAIMCLR, CTI Claim Tag Clear register

The CTICLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM bits, and to clear these bits to 0.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

CTICLAIMCLR is in the Debug power domain.

CTICLAIMCLR is optional to implement in the external register interface.

**Attributes**

CTICLAIMCLR is a 32-bit register.

**Field descriptions**

The CTICLAIMCLR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CLAIM[x], bit [x]</td>
</tr>
</tbody>
</table>

**CLAIM[x], bit [x], for x = 0 to 31**

Clear CLAIM tag. If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

Otherwise, reads return the value of CLAIM[x] and the behavior on writes is:

- 0: No action.
- 1: Indirectly clear CLAIM[x] to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

**Accessing the CTICLAIMCLR:**

CTICLAIMCLR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA4</td>
</tr>
</tbody>
</table>
H9.3.13  CTICLAIMSET, CTI Claim Tag Set register

The CTICLAIMSET characteristics are:

Purpose
Used by software to set CLAIM bits to 1.

Usage constraints
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations
CTICLAIMSET is in the Debug power domain.
CTICLAIMSET is optional to implement in the external register interface.

Attributes
CTICLAIMSET is a 32-bit register.

Field descriptions
The CTICLAIMSET bit assignments are:

```
+----+----+
| 31 | 0  |
+----+----+
      CLAIM[x], bit [x]
```

CLAIM[x], bit [x], for x = 0 to 31
 CLAIM tag set bit. If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

Otherwise, the bit is RAO and the behavior on writes is:

0   No action.
1   Indirectly set CLAIM[x] tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

Accessing the CTICLAIMSET:
CTICLAIMSET can be accessed through the internal memory-mapped interface and the external debug interface:

```
<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA0</td>
</tr>
</tbody>
</table>
```
H9.3.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

**Purpose**

 Controls whether the CTI is enabled.

**Usage constraints**

 This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

CTICONTROL is in the Debug power domain.

**Attributes**

CTICONTROL is a 32-bit register.

**Field descriptions**

The CTICONTROL bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:1]</td>
</tr>
<tr>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>GLBEN, bit [0]</td>
</tr>
</tbody>
</table>

**GLBEN, bit [0]**

Enables or disables the CTI mapping functions. Possible values of this field are:

0 CTI mapping functions disabled.

1 CTI mapping functions enabled.

When the mapping functions are disabled, no new events are signaled on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on External debug reset.

**Accessing the CTICONTROL:**

CTICONTROL can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x000</td>
</tr>
</tbody>
</table>
H9.3.15  CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIDEVAFF0 is in the Debug power domain.
CTIDEVAFF0 is optional to implement in the external register interface.

**Attributes**

CTIDEVAFF0 is a 32-bit register.

**Field descriptions**

The CTIDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>MPIDR_EL1 low half</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the CTIDEVAFF0:**

CTIDEVAFF0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA8</td>
</tr>
</tbody>
</table>
H9.3.16  CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTIDEVAFF1 is in the Debug power domain.
CTIDEVAFF1 is optional to implement in the external register interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

The CTIDEVAFF1 bit assignments are:

```
31 0

MPIDR_EL1 high half
```

Bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the CTIDEVAFF1:

CTIDEVAFF1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFAC</td>
</tr>
</tbody>
</table>
H9.3.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers’ model architecture of the CTI component.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTIDEVARCH is in the Debug power domain.

CTIDEVARCH is optional to implement in the external register interface.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

The CTIDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>21 20 19</th>
<th>16 15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>REVISION</td>
<td>ARCHID</td>
<td></td>
</tr>
</tbody>
</table>

PRESENT

ARCHITECT, bits [31:21]

Defines the architecture of the component. For CTI, this is ARM Limited.

Bits [31:28] are the JEP 106 continuation code, 0x4.

Bits [27:21] are the JEP 106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For CTI, the revision defined by ARMv8 is 0x0.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.
This corresponds to CTI architecture version CTIv2.

**Accessing the CTIDEVARCH:**

CTIDEVARCH can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFBC</td>
</tr>
</tbody>
</table>
H9.3.18 CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTIDEVID is in the Debug power domain.

Attributes

CTIDEVID is a 32-bit register.

Field descriptions

The CTIDEVID bit assignments are:

![Register Diagram]

Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented, this field is RAZ.

00 CTIGATE does not mask propagation of input events from external channels.

01 CTIGATE masks propagation of input events from external channels.

All other values are reserved.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. IMPLEMENTATION DEFINED. For ARMv8, valid values are:

000011 3 channels (0..2) implemented.

000100 4 channels (0..3) implemented.

000101 5 channels (0..4) implemented.

000110 6 channels (0..5) implemented.

and so on up to 100000, 32 channels (0..31) implemented.

All other values are reserved.
Bits [15:14]
Reserved, RES0.

NUMTRIG, bits [13:8]
Number of triggers implemented. IMPLEMENTATION DEFINED. This is one more than the index of the largest trigger, rather than the actual number of triggers.

For ARMv8, valid values are:
- 000011 Up to 3 triggers (0..2) implemented.
- 001000 Up to 8 triggers (0..7) implemented.
- 001001 Up to 9 triggers (0..8) implemented.
- 001010 Up to 10 triggers (0..9) implemented.

and so on up to 100000, 32 triggers (0..31) implemented.

All other values are reserved. If the implementation includes an ARM trace macrocell, this field must be at least 001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

Bits [7:5]
Reserved, RES0.

EXTMUXNUM, bits [4:0]
Maximum number of external triggers available for multiplexing into the CTI. This relates only to additional external triggers outside those defined for ARMv8.

Accessing the CTIDEVID:

CTIDEVID can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC8</td>
</tr>
</tbody>
</table>
H9.3.19 CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

**Purpose**

Reserved for future information about the CTI component to the debugger.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIDEVID1 is in the Debug power domain.

**Attributes**

CTIDEVID1 is a 32-bit register.

**Field descriptions**

The CTIDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td></td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Reserved, RES0.

**Accessing the CTIDEVID1:**

CTIDEVID1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC4</td>
</tr>
</tbody>
</table>
H9.3.20  CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

**Purpose**

Reserved for future information about the CTI component to the debugger.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIDEVID2 is in the Debug power domain.

**Attributes**

CTIDEVID2 is a 32-bit register.

**Field descriptions**

The CTIDEVID2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Reserved, RES0.

**Accessing the CTIDEVID2:**

CTIDEVID2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC0</td>
</tr>
</tbody>
</table>
H9.3.21 CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs cross-trigger interface.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIDEVTYPE is in the Debug power domain.

CTIDEVTYPE is optional to implement in the external register interface.

**Attributes**

CTIDEVTYPE is a 32-bit register.

**Field descriptions**

The CTIDEVTYPE bit assignments are:

```
<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SUB</td>
<td>MAJOR</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x4 to indicate this is a cross-trigger component.

**Accessing the CTIDEVTYPE:**

CTIDEVTYPE can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFCC</td>
</tr>
</tbody>
</table>
H9.3.22 CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose
Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

Usage constraints
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations
CTIGATE is in the Debug power domain.

Attributes
CTIGATE is a 32-bit register.

Field descriptions
The CTIGATE bit assignments are:

GATE<\(x\)>, bit [\(x\)], for \(x = 0 \text{ to } 31\)
Channel \(<x>\) gate enable.
Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the `CTIDEVID.NUMCHAN` field.
Possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Disable output and, if <code>CTIDEVID.INOUT == 0b01</code>, input channel (&lt;x&gt;) propagation.</td>
</tr>
<tr>
<td>1</td>
<td>Enable output and, if <code>CTIDEVID.INOUT == 0b01</code>, input channel (&lt;x&gt;) propagation.</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on External debug reset.

Accessing the CTIGATE:

CTIGATE can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x140</td>
</tr>
</tbody>
</table>
H9.3.23  CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

**Purpose**
Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**
CTIINEN<n> is in the Debug power domain.

**Attributes**
CTIINEN<n> is a 32-bit register.

**Field descriptions**
The CTIINEN<n> bit assignments are:

```
  31  0
    INEN<x>, bit [x]
```

**INEN<x>, bit [x], for x = 0 to 31**
Input trigger <n> to output channel <x> enable.
Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.
Possible values of this bit are:
- 0  Input trigger <n> will not generate an event on output channel <x>.
- 1  Input trigger <n> will generate an event on output channel <x>.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.
This field resets to its defined reset value on External debug reset.

**Accessing the CTIINEN<n>:**
CTIINEN<n> can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x020 + 4n</td>
</tr>
</tbody>
</table>
H9.3.24 CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to create soft acknowledges for output triggers.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>WO</td>
</tr>
</tbody>
</table>

A debugger must poll CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK.

Configurations

CTIINTACK is in the Debug power domain.

Attributes

CTIINTACK is a 32-bit register.

Field descriptions

The CTIINTACK bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACK&lt;(n)&gt;, bit ([n])</td>
<td></td>
</tr>
</tbody>
</table>

ACK<\(n\)>, bit \([n]\), for \(n = 0\) to \(31\)

Acknowledge for output trigger \(<n>\).

Bits \([31:\!N]\) are RAZ/WI. \(N\) is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

If any of the following is true, writes to ACK<\(n\)> are ignored:

- \(n \geq \) CTIDEVID.NUMTRIG, the number of implemented triggers.
- Output trigger \(n\) is not active.
- The channel mapping function output, as controlled by CTIOUTEN<\(n\)> is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<\(n\)> are ignored:

- Output trigger \(n\) is not implemented.
- Output trigger \(n\) is not connected.
- Output trigger \(n\) is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<\(n\)> is as follows:

<table>
<thead>
<tr>
<th>0</th>
<th>No effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Deactivate the trigger</td>
</tr>
</tbody>
</table>
Accessing the CTIINTACK:

CTIINTACK can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x010</td>
</tr>
</tbody>
</table>
H9.3.25  CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

**Purpose**

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

**Configurations**

CTIITCTRL is in the Debug power domain.

CTIITCTRL is optional to implement in the external register interface.

**Attributes**

CTIITCTRL is a 32-bit register.

**Field descriptions**

The CTIITCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:1</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td>Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>Normal operation.</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>Integration mode enabled.</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on IMPLEMENTATION DEFINED reset.

**Accessing the CTIITCTRL:**

CTIITCTRL can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF00</td>
</tr>
</tbody>
</table>
H9.3.26   CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>WO</th>
</tr>
</thead>
</table>

Configurations

CTILAR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.

CTILAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

The CTILAR bit assignments are:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Accessing the CTILAR:

CTILAR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF80</td>
</tr>
</tbody>
</table>
H9.3.27  CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the software lock for CTI registers.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Configurations

CTILSR is in the Debug power domain.

If optional memory-mapped access to the external debug interface is supported then an optional Software lock can be implemented as part of CoreSight compliance.

CTILSR is RAZ if the Software lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions

The CTILSR bit assignments are:

```
+----+----+----+----+
| 31 | 30 | 29 | 28 |
+----+----+----+----+

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

Software lock status for this component. For an access to LSR that is not a memory-mapped access, or when the software lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:

- 0: Lock clear. Writes are permitted to this component's registers.
Lock set. Writes to this component's registers are ignored, and reads have no side effects.

When this register has an architecturally-defined reset value, this field resets to 1.

This field resets to its defined reset value on External debug reset.

**SLI, bit [0]**

Software lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

- 0: Software lock not implemented or not memory-mapped access.
- 1: Software lock implemented and memory-mapped access.

**Accessing the CTILSR:**

CTILSR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF84</td>
</tr>
</tbody>
</table>
H9.3.28   CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

**Purpose**

 Defines which input channels generate output trigger n.

**Usage constraints**

 This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

 CTIOUTEN<n> is in the Debug power domain.

**Attributes**

 CTIOUTEN<n> is a 32-bit register.

**Field descriptions**

The CTIOUTEN<n> bit assignments are:

<table>
<thead>
<tr>
<th>OUTEN&lt;x&gt;, bit [x]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 0</td>
</tr>
</tbody>
</table>

**OUTEN<x>, bit [x], for x = 0 to 31**

 Input channel <x> to output trigger <n> enable.

 Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

 Possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>An event on input channel &lt;x&gt; will not cause output trigger &lt;n&gt; to be asserted.</td>
</tr>
<tr>
<td>1</td>
<td>An event on input channel &lt;x&gt; will cause output trigger &lt;n&gt; to be asserted.</td>
</tr>
</tbody>
</table>

 When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

 This field resets to its defined reset value on External debug reset.

**Accessing the CTIOUTEN<n>:**

 CTIOUTEN<n> can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xA0 + 4n</td>
</tr>
</tbody>
</table>
H9.3.29 CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

**Purpose**
- Provides information to identify a CTI component.

**Usage constraints**
- This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**
- CTIPIDR0 is in the Debug power domain.
- CTIPIDR0 is optional to implement in the external register interface.
- This register is required for CoreSight compliance.

**Attributes**
- CTIPIDR0 is a 32-bit register.

**Field descriptions**
- The CTIPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8-0</td>
<td>PART_0, part number, least significant byte</td>
</tr>
</tbody>
</table>

**Accessing the CTIPIDR0:**
- CTIPIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE0</td>
</tr>
</tbody>
</table>
**H9.3.30 CTIPIDR1, CTI Peripheral Identification Register 1**

The CTIPIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIPIDR1 is in the Debug power domain.

CTIPIDR1 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR1 is a 32-bit register.

**Field descriptions**

The CTIPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>DES_0</td>
<td>PART_1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is 0b1011.

**PART_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the CTIPIDR1:**

CTIPIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE4</td>
</tr>
</tbody>
</table>
H9.3.31  CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIPIDR2 is in the Debug power domain.

CTIPIDR2 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR2 is a 32-bit register.

**Field descriptions**

The CTIPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
<th>31</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0.</td>

<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is 0b011.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the CTIPIDR2:**

CTIPIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE8</td>
</tr>
</tbody>
</table>
H9.3.32  CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIPIDR3 is in the Debug power domain.

CTIPIDR3 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR3 is a 32-bit register.

**Field descriptions**

The CTIPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>REVAND</td>
<td>CMOD</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the CTIPIDR3:**

CTIPIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFEC</td>
</tr>
</tbody>
</table>
H9.3.33  CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

**Purpose**

Provides information to identify a CTI component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIPIDR4 is in the Debug power domain.

CTIPIDR4 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR4 is a 32-bit register.

**Field descriptions**

The CTIPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>7:4</td>
<td>SIZE, bits [7:4]</td>
<td></td>
</tr>
</tbody>
</table>

Size of the component. RAZ. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>3:0</td>
<td>DES_2, bits [3:0]</td>
<td>0b100</td>
</tr>
</tbody>
</table>

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is 0b0100.

**Accessing the CTIPIDR4:**

CTIPIDR4 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFD0</td>
</tr>
</tbody>
</table>
H9.3.34 CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTITRIGINSTATUS is in the Debug power domain.

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions

The CTITRIGINSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>TRIN&lt;n&gt;, bit [n]</td>
</tr>
</tbody>
</table>

TRIN<n>, bit [n], for n = 0 to 31

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Input trigger n is inactive.</td>
</tr>
<tr>
<td>1</td>
<td>Input trigger n is active.</td>
</tr>
</tbody>
</table>

Not implemented and not-connected input triggers are always inactive.

Accessing the CTITRIGINSTATUS:

CTITRIGINSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x130</td>
</tr>
</tbody>
</table>
H9.3.35   CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose
Provides the status of the trigger outputs.

Usage constraints
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations
CTITRIGOUTSTATUS is in the Debug power domain.

Attributes
CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions
The CTITRIGOUTSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TROUT&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

TROUT<n>, bit [n], for n = 0 to 31
Trigger output <n> status.
Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.
If output trigger <n> is implemented and connected, possible values of this bit are:
0   Output trigger n is inactive.
1   Output trigger n is active.
Otherwise it is IMPLEMENTATION DEFINED whether TROUT<n> is RAZ or behaves as above.

Accessing the CTITRIGOUTSTATUS:
CTITRIGOUTSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x134</td>
</tr>
</tbody>
</table>
Part I

Memory-mapped Components of the ARMed Architecture
Chapter I1
System Level Implementation of the Generic Timer

This chapter defines the system level implementation of the Generic Timer. It contains the following sections:

- About the Generic Timer specification on page I1-5250.
- Memory-mapped counter module on page I1-5251.
- Counter module control and status register summary on page I1-5254.
- Memory-mapped timer components on page I1-5256.
- The CNTBaseN and CNTEL0BaseN frames on page I1-5257.
- The CNTCTLBase frame on page I1-5259.
- Providing a complete set of counter and timer features on page I1-5260.
- Gray-count scheme for timer distribution scheme on page I1-5262.

Note

- Generic Timer memory-mapped register descriptions on page I3-5325 describes the System level Generic Timer registers. These registers are memory-mapped.

- Chapter D6 The Generic Timer in AArch64 state gives a general description of the Generic Timer, and describes the system control register interface to the Generic Timer.
I1.1 About the Generic Timer specification

Chapter D6 The Generic Timer in AArch64 state describes the ARM Generic Timer and its implementation. Chapter D6 includes the definition of the low-latency System register interface to the Generic Timer. However, the ARM Generic Timer architecture requires the inclusion of a memory-mapped component, the memory-mapped counter module, to control the generation of the Count value used by the Generic Timers. This is described in Memory-mapped counter module on page I1-5251.

In addition, the Generic Timer architecture specifies the architecture of an optional memory-mapped timer component which can be used in systems to provide a standardized way of providing timers for programmable system components other than PEs using the ARM architecture with coprocessor-mapped timers. These are described in Memory-mapped timer components on page I1-5256.

I1.1.1 Registers in the system level implementation of the Generic Timer

Registers that control components of the system level implementation of the Generic Timer are grouped into frames. This specification defines the registers in each frame, and their offsets within the frame. The system defines the position of each frame in the memory map. This means the base addresses for each frame is IMPLEMENTATION DEFINED.

Note

The final twelve words of the first or only 4KB block of a register memory frame is an ID block.
I1.2 Memory-mapped counter module

The memory-mapped counter module provides top-level control of the system counter. The CNTControlBase frame holds the registers for the memory-mapped counter, and provides:

- A RW control register CNTCR, that provides:
  - An enable bit for the system counter.
  - An enable bit for Halt-on-Debug. When this is enabled, if the debug halt signal into the system counter is asserted, it halts the system counter. Otherwise, the system counter ignores the state of this halt signal. For more information about Halt-on-Debug, contact ARM.
  - A field that can be written to request a change to the update frequency of the system counter, with a corresponding change to the increment made at each update. For more information see Control of counter operating frequency and increment on page I1-5252.

Writes to this register are rare. In a system that uses security, this register is writable only by Secure writes.

- A RO status register, CNTSR, that provides:
  - A bit that indicates whether the system counter is halted because of an asserted Halt-on-Debug signal.
  - A field that indicates the current update frequency of the system counter. This field can be polled to determine when a requested change to the update frequency has been made.

- Two contiguous 32-bit RW registers that hold the current system counter value, CNTCV. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

The system counter must be disabled before writing to these registers, otherwise the effect of the write is UNPREDICTABLE.

Writes to these registers are rare. In a system that uses security, these registers are writable only by Secure writes.

- A table of one or more 32-bit entries, where:
  - The first entry defines the base frequency of the system counter. This is the maximum frequency at which the counter updates.
  - Each subsequent entry defines an alternative frequency of the system counter, and must be an exact divisor of the base frequency.

A 32-bit zero entry immediately follows the last table entry.

This table can be WO or RW. For more information, see The frequency modes table on page I1-5252.

In addition, the CNTReadBase frame includes a read-only copy of CNTCV, as two contiguous 32-bit RO registers. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

Counter module control and status register summary on page I1-5254 describes CNTReadBase and CNTControlBase memory maps, and the registers in each frame.
Control of counter operating frequency and increment

The system counter has a fixed base frequency, and must maintain the required counter accuracy, meaning ARM recommends that it does not gain or lose more than ten seconds in a 24-hour period, see System counter on page D6-1893. However, the counter can increment at a lower frequency than the base frequency, using a correspondingly larger increment. For example, it can increment by four at a quarter of the base frequency. Any lower-frequency operation, and any switching between operating frequencies, must not reduce the accuracy of the counter.

Control of the system counter frequency and increment is provided only through the memory-mapped counter module. The following sections describe this control:

• The frequency modes table.
• Changing the system counter and increment.

The frequency modes table

The frequency modes table starts at offset 0x20 from CNTControlBase.

Table entries are 32-bits, and each entry specifies a system counter update frequency, in Hz.

The first entry in the table specifies the base frequency of the system counter.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

\[
\text{increment} = \frac{\text{base\_frequency}}{\text{selected\_frequency}}
\]

A 32-bit word of zero value marks the end of the table. That is, the word of memory immediately after the last entry in the table must be zero.

The only required entry in the table is the entry for the base frequency.

Typically, the frequency modes table are in RO memory. However, a system implementation might use RW memory for the table, and initialize the table entries as part of its startup sequence. Therefore, the CNTControlBase memory map shows the table region as RO or RW.

ARM strongly recommends that the frequency modes table is not updated once the system is running.

The architecture can support up to 1004 entries in the frequency modes table, and the maximum number of entries is IMPLEMENTATION DEFINED, up to this limit.

Note

ARM considers it unlikely that implementations will require significantly fewer entries than the architectural limit.

Changing the system counter and increment

The value of the CNTCR.FREQ field specifies which frequency modes table entry specifies the system counter update frequency.

Changing the value of CNTCR.FREQ requests a change to the system counter update frequency. To ensure the frequency change does not affect the overall accuracy of the counter, it is made as follows:

• When changing from a higher frequency to a lower frequency, the counter:
  1. Continues running at the higher frequency until the count reaches an integer multiple of the required lower frequency.
  2. Switches to operating at the lower frequency.
• When changing from a lower frequency to a higher frequency, the counter:
  1. Waits until the end of the current lower-frequency cycle.
  2. Makes the counter increment required for operation at that lower frequency.
  3. Switches to operating at the higher frequency.
When the frequency has changed, CNTSR is updated to indicate the new frequency. Therefore, a system component that is waiting for a frequency change can poll CNTSR to detect the change.
### 11.3 Counter module control and status register summary

The Counter module control and status registers are memory-mapped registers in the following register memory frames:

- A control frame, with base address CNTControlBase.
- A status frame, with base address CNTReadBase.

Each of these register memory frames is at least 4KB in size, or is at least the size of the memory protection granule if this granule size is larger than 4KB. Similarly, each base address must be aligned to 4KB, or to the memory protection granule if that is larger than 4KB.

--- **Note** ---

The memory protection granule is either 4KB or 64KB.

---

In each register memory frame, the memory at offset 0xFD0-0xFFF is reserved for twelve 32-bit IMPLEMENTATION DEFINED ID registers, see the CounterID<\text{n}> register descriptions for more information.

The counter is assumed to be little-endian.

In an implementation that supports Secure and Non-secure memory spaces, CNTControlBase is implemented only in the Secure memory space.

Table I1-1 shows the CNTControlBase control registers, in order of their offsets from CNTControlBase. *Generic Timer memory-mapped register descriptions on page I3-5325* describes each of these registers.

I1.4 Memory-mapped timer components

In order to make a separate set of Generic Timer facilities with equivalent functionality available to programmable system components that do not themselves incorporate a Generic Timer as a coprocessor-mapped component, the Generic Timer specification defines an optional memory-mapped component that can be placed close to such a programmable system component.

The memory map consists of up to 8 timer frames. Each timer frame:

- Provides its own set of timers and associated interrupts.
- Is in its own memory protection region that is:
  - In its own memory protection region, with a system-defined size of 4KB or 64KB.
  - At a start address that is aligned to 4KB.

--- Note ---

The 4KB alignment requirement applies regardless of the memory protection region size.

The base address of a frame is CNTBaseN, where N numbers from 0 up to a maximum permitted value of 7.

The system provides a second view of each implemented CNTBaseN frame. The base address of the second view of the CNTBaseN frame is CNTEL0BaseN, and in this view:

- All registers visible in CNTBaseN are visible, except for CNTVOFF and CNTEL0ACR.
- The offsets of all visible registers are the same as their offsets in the CNTBaseN frame.

In addition, the system provides a control frame at base address CNTCTLBase.

The memory protection region and alignment requirements for the CNTEL0BaseN and CNTCTLBase frames are the same as the requirements for the CNTBaseN frames.

The system defines the position of each frame in the memory map. This means the values of each of the CNTBaseN, CNTEL0BaseN, and CNTCTLBase base addresses is IMPLEMENTATION DEFINED.

The memory-mapped timers are assumed to be little-endian.

The following sections describe the implementation of a memory-mapped view of the counter and timer:

- The CNTBaseN and CNTEL0BaseN frames on page I1-5257.
- The CNTEL0ACR frame on page I1-5258.
- Providing a complete set of counter and timer features on page I1-5260.
I1.5 The CNTBaseN and CNTEL0BaseN frames

Table I1-3 shows the CNTBaseN registers, in order of their offsets from CNTBaseN. Whether a frame includes a virtual timer is **IMPLEMENTATION DEFINED**. If it does not then memory at offsets 0x030-0x03C is RAZ/WI. Except for CNTEL0ACR and the CounterID<\(n\)> registers, these registers are also implemented in the system control register interface to the Generic Timer.

*Generic Timer memory-mapped register descriptions on page I3-5325 describes each of these registers.*

</tbody>
</table>

- These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in *Generic Timer registers on page D7-2265* and *Generic Timer registers on page G6-4845*. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.
- But must be writable for initial configuration.
- Address is reserved, RAZ/WI if register not implemented.
- The CNTRLBase frame includes a RW view of this register.

For any value of \(N\), the layout of the registers in the frame at CNTEL0BaseN is identical to that at CNTBaseN, except that:

- CNTVOFF is not visible, and the memory at 0x018-0x01C is RAZ/WI.
- CNTEL0ACR is never visible, and the memory at 0x014 is always RAZ/WI.
• If implemented in the frame at CNTBase\(N\), \texttt{CNTEL0ACR} controls whether \texttt{CNTPCT}, \texttt{CNTVCT}, \texttt{CNTFRQ}, the EL1 Physical Timer, and the Virtual Timer registers are visible in the frame at CNTEL0Base\(N\). If \texttt{CNTEL0ACR} is not implemented then these registers are not visible in the frame at CNTEL0Base\(N\), and their addresses are RAZ/WI.

• If \texttt{CNTFRQ} is visible it is always RO. That is, it is not RW for initial configuration.

If an implementation supports 64-bit atomic accesses, then \texttt{CNTPCT}, \texttt{CNTVCT}, \texttt{CNTVOFF}, \texttt{CNTP_CVAL}, and \texttt{CNTV_CVAL} must be accessible as atomic 64-bit values.
## I1.6 The CNTCTLBase frame

The CNTCTLBase frame contains an identification register for the features of the memory-mapped counter and timer implementation, access controls for each CNTBase frame, and a virtual offset register for frames that implement a virtual timer. Table I1-4 shows the CNTCTLBase registers, in order of their offsets from CNTCTLBase. The CNTFRQ and CNTVOFF registers are also implemented in the Secure system control register interface to the Generic Timer.

*Generic Timer memory-mapped register descriptions on page I3-5325* describes each of these registers.

</table>

a. These registers are also defined in the Secure System registers interface to the Generic Timer, and therefore are also described in *Generic Timer registers on page D7-2263* and *Generic Timer registers on page G6-4845*. The bit assignments of the registers are identical in the System registers interface and in the memory-mapped system level interface.

b. Implemented for each value of N from 0 to 7.

c. The CNTNSAR determines the Non-secure accessibility of the CNTACR<sub>N</sub>s and the CNTVOFF<sub>N</sub>s in the CNTCTLBase frame. For more information, see the register descriptions.

d. Address is reserved, RAZ/WI if register not implemented.
I1.7 Providing a complete set of counter and timer features

Using the general model for implementing a memory-mapped interface to the Generic Timer described in this section, the feature set of a System registers counter and timer, in an implementation that includes EL2 and EL3, can be implemented using the following set of timer frames:

- A CNTCTLBase control frame.
- The following CNTBase0 timer frames:
  - **Frame 0** Accessible from Non-secure state, with second view and virtual capability. This provides the Non-secure EL1&0 timers.
  - **Frame 1** Accessible from Non-secure state, with no second view and no virtual capability. This provides the Non-secure EL2 timers.
  - **Frame 2** Accessible only Secure state, with a second view but no virtual capability. This provides the Secure EL1&0 timers.

In this implementation, the full set of implemented frames, and their configuration in the memory map, is as follows:

**CNTCTLBase**
The control frame. This frame is located in both Secure and Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is not accessible.

**CNTBase0**
The first view of the Non-secure EL1&0 timers. This frame is located only in Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is accessible only at EL1.

**CNTEL0Base0**
The second view of CNTBase0, meaning it is the EL0 view of the Non-secure EL1&0 timers. This frame is located only in Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame can be accessible at EL1, or at EL1 and EL0, but this is not required.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is accessible at EL1 and EL0.

**CNTBase1**
The first and only view of the Non-secure EL2 timers. This frame is located only in Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is not accessible.

**CNTBase2**
The first view of the Secure EL1&0 timers. This frame is located only in Secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- Because the frame is in Secure memory, it is not accessible in any Non-secure translation regime.

**CNTEL0Base2**
The second view of CNTBase2, meaning it is the EL0 view of the Secure EL1&0 timers. This frame is located only in Secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible at EL1 and EL0.
- Because the frame is in Secure memory, it is not accessible in any Non-secure translation regime.
Note

About VMSAv8-32 on page G4-4062 describes the translation regimes.
I1.8 Gray-count scheme for timer distribution scheme

The distribution of the Counter value using a Gray-code provides a relatively simple mechanism to avoid any danger of the count being sampled with an intermediate value even if the clocking is asynchronous. It has a further advantage that the distribution is relatively low power, since only one bit changes on the main distribution wires for each clock tick.

A suitable Gray-coding scheme can be achieved with the following logic:

Gray[N] = Count[N]

Gray[i] = (XOR(Gray[N:i+1])) XOR Count[i] for N–1 >= i >= 0

Count[i] = XOR(Gray[N:i]) for N >= i >= 0

This is for an N+1 bit counter, where Count is a conventional binary count value, and Gray is the corresponding Gray count value.

Note

This scheme has the advantage of being relatively simple to switch, in either direction, between operating with low-frequency and low-precision, and operating with high-frequency and high-precision. To achieve this, the ratio of the frequencies must be 2^n, where n is an integer. A switch-over can occur only on the 2n+1 boundary to avoid losing the Gray-coding property on a switch-over.
Chapter I2
Recommended Memory-mapped Interfaces to the Performance Monitors

This chapter describes the recommended memory-mapped and external debug interfaces to the Performance Monitors. It contains the following section:

• About the memory-mapped views of the Performance Monitors registers on page I2-5264.

Note
Performance Monitors memory-mapped register descriptions on page I3-5273 describes the memory-mapped registers for the Performance Monitors.
I2.1 About the memory-mapped views of the Performance Monitors registers

An implementation can provide:

- Memory-mapped access to the Performance Monitors registers. Software running on any processor in a system can use this interface to access counters in the Performance Monitors.
- Access to the Performance Monitors registers through an external debug interface. A debugger can use this interface to access counters in the Performance Monitors.

ARM recommends that any external debug interface is implemented as defined in the ARM Debug Interface v5 Architecture Specification.

An external debug interface provides a memory-mapped view of the Performance Monitors registers.

Performance Monitors memory-mapped registers summary on page I3-5271 gives the memory map of these registers.

The following sections describe the memory-mapped views of the Performance Monitors registers:

- Differences in the memory-mapped views of the Performance Monitors registers.
- Synchronization of changes to the memory-mapped views.
- Access permissions for memory-mapped views of the Performance Monitors.

In this section, unless the context explicitly indicates otherwise, any reference to a memory-mapped view applies equally to a register view using:

- A memory-mapped access.
- A access through an external debug interface.

I2.1.1 Differences in the memory-mapped views of the Performance Monitors registers

A memory-mapped view of the Performance Monitors registers accesses the same registers as the System registers interface described in Performance Monitors Extension registers on page D5-1884, except that:

1. The PMSELR is accessible only in the System registers interface.
2. The PMCFGR, PMLAR, PMLSR, PMAUTHSTATUS, PMDEVARCH, PMDEVTYP, PMPIDR0, PMPIDR1, PMPIDR2, PMPIDR3, PMPIDR4, PMCIDR0, PMCIDR1, PMCIDR2, and PMCIDR3 registers are accessible only in memory-mapped views. Performance Monitors memory-mapped register descriptions on page I3-5273 describes these registers.
3. The following controls do not affect the memory-mapped view:
   - PMSELR.
   - PMUSERENR.
   - HDCR.{TPM, TPMCR, HPMN}.

Instead, see the register descriptions in Chapter I3 Memory-Mapped System Register Descriptions.

I2.1.2 Synchronization of changes to the memory-mapped views

If a Performance Monitor is visible in both system register and a memory-mapped views, and is accessed simultaneously through these two mechanisms, the behavior must be as if the access occurred atomically in any order. For more information, see Synchronization of changes to the external debug registers on page H8-5102.

I2.1.3 Access permissions for memory-mapped views of the Performance Monitors

For more information, see External debug interface register access permissions on page H8-5108.

Table I2-1 on page I2-5265 shows the access permissions for the Performance Monitors registers in a v8 Debug implementation. This table uses the following terms:

**DLK** When the OS Double Lock is locked, EDPRSR.DLK == 1, accesses to some registers produce an error. Applies to both interfaces.
### EPMAD
When `AllowExternalPMUAccess()` == FALSE, external debug access is disabled. See also Behavior of a not permitted memory-mapped access on page H8-5107.

### Error
Indicates that the access gives an error response.

### Default
This shows the default access permissions, if none of the conditions in this list prevent access to the register.

### Off
When `EDPRSR.PU` == 0, the Core power domain is completely off, or in a low-power state where the Core power domain registers cannot be accessed.

--- **Note**
If debug power is off, then all external debug interface accesses return an error.

--- **OSLK**
When the OS Lock is locked, `OSLAR_EL1.OSLK` == 1, accesses to some registers produces an error. This column shows the effect of this control on accesses using the external debug interface.

--- **SLK**
This indicates the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software lock is locked. See Register access permissions for memory-mapped accesses on page H8-5106.

For all other accesses, this column is ignored.

--- **-**
Indicates that the control has no effect on the behavior of the access:
- If no other control affects the behavior, the Default access behavior applies.
- However, another control might determine the behavior.

I2 Recommended Memory-mapped Interfaces to the Performance Monitors

I2.1 About the memory-mapped views of the Performance Monitors registers

I2.1.4 Power domains and Performance Monitors registers reset

For ARMv8-A implementations, ARM recommends that Performance Monitors are implemented as part of the core power domain, not as part of a separate debug power domain. There is no interface to access the Performance Monitors registers when the core power domain is powered down.

A Warm or Cold reset sets the Performance Monitors registers to their reset values. An External Debug reset does not change the values of the Performance Monitors registers.

For more information about the reset scheme recommended for a v8 Debug implementation see Chapter H6 Debug Reset and Powerdown Support.

Table I2-2 shows the Performance Monitors register resets for writable register fields. The column headings use the following terms:

- **64**: This is the architectural reset value when resetting into AArch64 state.
- **32**: This is the architectural reset value when resetting into AArch32 state.
- **-**: This indicates an IMPLEMENTATION DEFINED reset value on the specified reset. This might be UNKNOWN.

**Note**

This table does not include:

- Read-only identification registers and fields that have a fixed value. In this case, the reset value is that fixed value. An example of this is PMCR_EL0.N.
- Write-only registers and fields that only have an effect on writes. These do not have a reset value. An example of this is PMSWINC_EL0.
- IMPLEMENTATION DEFINED registers, In this case, the reset domains are IMPLEMENTATION DEFINED. The reset values are IMPLEMENTATION DEFINED and might be UNKNOWN.

Chapter I3
Memory-Mapped System Register Descriptions

This chapter describes the memory-mapped system control registers. It contains the following sections:

- *About the memory-mapped system register descriptions* on page I3-5270.
- *Performance Monitors memory-mapped registers summary* on page I3-5271.
- *Performance Monitors memory-mapped register descriptions* on page I3-5273.
- *Generic Timer memory-mapped registers overview* on page I3-5324.
- *Generic Timer memory-mapped register descriptions* on page I3-5325.
I3.1  About the memory-mapped system register descriptions

This chapter describes the memory-mapped system control registers other than the memory-mapped debug registers. That is, it describes:

The memory-mapped view of the Performance Monitors registers

- Performance Monitors memory-mapped registers summary on page I3-5271 lists these registers and describes their memory map.
- Performance Monitors memory-mapped register descriptions on page I3-5273 describes each of the memory-mapped registers.

Chapter I2 Recommended Memory-mapped Interfaces to the Performance Monitors describes the recommended interface to these registers.

——— Note ————

Chapter D5 The Performance Monitors Extension describes the Performance Monitors. The following sections describe the System register interfaces to the Performance Monitors:

- Performance Monitors registers on page D7-2223, for accesses from an Exception level that is using AArch64.
- Performance Monitors registers on page G6-4802, for accesses from an Exception level that is using AArch32.

——— Note ————

The registers for the system-level Generic Timer component

Any implementation that includes the Generic Timer must include the memory-mapped system-level component described in Chapter I1 System Level Implementation of the Generic Timer. In this chapter:

- Generic Timer memory-mapped registers overview on page I3-5324 gives an overview of the registers, referring to Chapter I1 for more information.
- Generic Timer memory-mapped register descriptions on page I3-5325 describes each of the memory-mapped registers.

——— Note ————

Chapter D6 The Generic Timer in AArch64 state describes the Generic Timer component that is accessible using the System registers. The following sections describe the System register interfaces to that component:

- Generic Timer registers on page D7-2263, for accesses from an Exception level that is using AArch64.
- Generic Timer registers on page G6-4845, for accesses from an Exception level that is using AArch32.
I3.2 Performance Monitors memory-mapped registers summary

The locations of the registers in the memory-mapped view of the Performance Monitors are defined as offsets from a system-defined base address. Performance Monitors memory-mapped register views defines this memory map.

I3.2.1 Performance Monitors memory-mapped register views

Table I3-1 shows the memory-mapped view of the Performance Monitors registers. All other entries are reserved.

### Note

- Counters that are reserved because HDCR.HPMN has been changed from its reset value remain visible in any memory-mapped view.
- The registers that relate to an implemented event counter, PMN<n>, are PMEVCNTR<n> and PMEVTYPER<n>.
- The mapping of the Performance Monitors Event Counter Registers, at offsets 0x000-0x0F4, has changed compared to the mappings of the equivalent registers in ARMv7.

Each entry in the Name column links to the register description in Performance Monitors memory-mapped register descriptions on page I3-5273, and:

- If the System register? column of the table shows that the register is a System register, the memory-mapped interface provides a view of the System register described in:
  - Performance Monitors registers on page D7-2223, for the AArch64 System register.
  - Performance Monitors registers on page G6-4802, for the AArch32 System register.
- Otherwise, the register is accessible only using the memory-mapped interface.

a. The interface must support at least single-copy atomic 32-bit accesses. If single-copy atomic 64-bit access to the registers is not possible, software must use a high-low-high read access to read the counter value if the counter is enabled.

b. CoreSight interface registers, see Management registers and CoreSight compliance on page J2-5461.

c. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.
I3.3 Performance Monitors memory-mapped register descriptions

This section describes the Performance Monitoring registers. *Performance Monitors memory-mapped registers summary on page I3-5271* lists these registers in their memory map.
I3.3.1 PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

PMAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. ARM recommends that this register is implemented.

Attributes

PMAUTHSTATUS is a 32-bit register.

Field descriptions

The PMAUTHSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SNID</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as DBGAUTHSTATUS_EL1.SNID.

Bits [5:4]

Reserved, RES0.

NSNID, bits [3:2]

Holds the same value as DBGAUTHSTATUS_EL1.NSNID.

Bits [1:0]

Reserved, RES0.
Accessing the PMAUTHSTATUS:

PMAUTHSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF8</td>
</tr>
</tbody>
</table>
I3.3.2 PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMCCFILTR_EL0 is architecturally mapped to AArch64 System register PMCCFILTR_EL0.

External register PMCCFILTR_EL0 is architecturally mapped to AArch32 System register PMCCFILTR.

PMCCFILTR_EL0 is in the Core power domain.

**Attributes**

PMCCFILTR_EL0 is a 32-bit register.

**Field descriptions**

The PMCCFILTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>P U M RES0 NSK NSU NSH</td>
</tr>
</tbody>
</table>

**P, bit [31]**

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-safe EL1 is further controlled by the NSK bit. The possible values of this bit are:

- 0  Count cycles in EL1.
- 1  Do not count cycles in EL1.

**U, bit [30]**

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-safe EL0 is further controlled by the NSU bit. The possible values of this bit are:

- 0  Count cycles in EL0.
- 1  Do not count cycles in EL0.

**NSK, bit [29]**

Non-safe EL1 (kernel) modes filtering bit. Controls counting in Non-safe EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Non-safe EL1 are counted.
Otherwise, cycles in Non-secure EL1 are not counted.

**NSU, bit [28]**

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted. Otherwise, cycles in Non-secure EL0 are not counted.

**NSH, bit [27]**

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

- 0: Do not count cycles in EL2.
- 1: Count cycles in EL2.

**M, bit [26]**

Secure EL3 filtering bit. Most applications can ignore this bit and set the value to zero. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Secure EL3 are counted. Otherwise, cycles in Secure EL3 are not counted.

**Bits [25:0]**

Reserved, RES0.

**Accessing the PMCCFILTR_EL0:**

PMCCFILTR_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x47C</td>
</tr>
</tbody>
</table>
I3.3.3   PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter* on page D5-1850 for more information.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMCCNTR_EL0 is architecturally mapped to AArch64 System register PMCCNTR_EL0.

External register PMCCNTR_EL0 is architecturally mapped to AArch32 System register PMCCNTR.

PMCCNTR_EL0 is in the Core power domain.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCNTR_EL0 bit assignments are:

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

<table>
<thead>
<tr>
<th>63-0</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>CCNT</td>
<td></td>
</tr>
</tbody>
</table>
```

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

**Accessing the PMCCNTR_EL0:**

PMCCNTR_EL0[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x0F8</td>
</tr>
</tbody>
</table>
PMCCNTR_EL0[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x0FC</td>
</tr>
</tbody>
</table>
I3.3.4 PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMCEID0_EL0 is architecturally mapped to AArch64 System register PMCEID0_EL0.
External register PMCEID0_EL0 is architecturally mapped to AArch32 System register PMCEID0.
PMCEID0_EL0 is in the Core power domain.

**Attributes**

PMCEID0_EL0 is a 32-bit register.

**Field descriptions**

The PMCEID0_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ID[31:0]</td>
</tr>
</tbody>
</table>

**ID[31:0], bits [31:0]**

PMCEID0_EL0[n] maps to event n. For a list of event numbers and descriptions, see *Events, Event numbers and mnemonics* on page D5-1865.

For each bit:

- **0** The common event is not implemented.
- **1** The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

**Accessing the PMCEID0_EL0:**

PMCEID0_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE20</td>
</tr>
</tbody>
</table>
I3.3.5 PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th></th>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMCEID1_EL0 is architecturally mapped to AArch64 System register PMCEID1_EL0.

External register PMCEID1_EL0 is architecturally mapped to AArch32 System register PMCEID1.

PMCEID1_EL0 is in the Core power domain.

**Attributes**

PMCEID1_EL0 is a 32-bit register.

**Field descriptions**

The PMCEID1_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>ID[63:32]</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000000</td>
</tr>
</tbody>
</table>

**ID[63:32], bits [31:0]**

PMCEID1_EL0[n] maps to event (n + 32). For a list of event numbers and descriptions, see Events, Event numbers and mnemonics on page D5-1865.

For each bit:

- **0** The common event is not implemented.
- **1** The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

**Accessing the PMCEID1_EL0:**

PMCEID1_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE24</td>
</tr>
</tbody>
</table>
I3.3.6 PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

**Purpose**
Contains PMU-specific configuration data.

**Usage constraints**
This register is accessible as follows:

**Configurations**
PMCFGR is in the Core power domain.

**Attributes**
PMCFGR is a 32-bit register.

**Field descriptions**
The PMCFGR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td></td>
<td><strong>UEN</strong> bit [19]</td>
</tr>
<tr>
<td></td>
<td>User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RES0.</td>
</tr>
<tr>
<td></td>
<td><strong>WT</strong> bit [18]</td>
</tr>
<tr>
<td></td>
<td>This feature is not supported, so this bit is RES0.</td>
</tr>
<tr>
<td></td>
<td><strong>NA</strong> bit [17]</td>
</tr>
<tr>
<td></td>
<td>This feature is not supported, so this bit is RES0.</td>
</tr>
<tr>
<td></td>
<td><strong>EX</strong> bit [16]</td>
</tr>
<tr>
<td></td>
<td>Export supported. Value is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0</td>
<td>PMCR_EL0.X is RES0.</td>
</tr>
<tr>
<td>1</td>
<td>PMCR_EL0.X is read/write.</td>
</tr>
<tr>
<td></td>
<td><strong>CCD</strong> bit [15]</td>
</tr>
<tr>
<td></td>
<td>Cycle counter has prescale. This is RES1 if AArch32 is supported at any EL, and RES0 otherwise.</td>
</tr>
<tr>
<td>0</td>
<td>PMCR_EL0.D is RES0.</td>
</tr>
</tbody>
</table>
PMCR_EL0.D is read/write.

CC, bit [14]
Dedicated cycle counter (counter 31) supported. This bit is RES1.

SIZE, bits [13:8]
Size of counters. This field determines the spacing of counters in the memory-map.
In ARMv8 the counters are at doubleword-aligned addresses, and the largest counter is 64-bits, so this field is 0b111111.

N, bits [7:0]
Number of counters implemented in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31, so bits[7:5] are always RES0.
00000000 Only PMCCNTR_EL0 implemented.
00000001 PMCCNTR_EL0 plus one event counter implemented.
and so on up to 00011111, which indicates PMCCNTR_EL0 and 31 event counters implemented.

**Accessing the PMCFGR:**

PMCFGR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE00</td>
</tr>
</tbody>
</table>
I3.3.7 PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMCIDR0 is in the Debug power domain.

PMCIDR0 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR0 is a 32-bit register.

**Field descriptions**

The PMCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td></td>
<td>PRMBL_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as 0x0D.

**Accessing the PMCIDR0:**

PMCIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF0</td>
</tr>
</tbody>
</table>
I3.3.8 PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

- PMCIDR1 is in the Debug power domain.
- PMCIDR1 is optional to implement in the external register interface.
- This register is required for CoreSight compliance.

**Attributes**

- PMCIDR1 is a 32-bit register.

**Field descriptions**

The PMCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8:7</td>
<td>CLASS</td>
</tr>
<tr>
<td>3:0</td>
<td>PRMBL_1</td>
</tr>
</tbody>
</table>

**Accessing the PMCIDR1:**

PMCIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF4</td>
</tr>
</tbody>
</table>
I3.3.9 PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

- PMCIDR2 is in the Debug power domain.
- PMCIDR2 is optional to implement in the external register interface.
- This register is required for CoreSight compliance.

**Attributes**

PMCIDR2 is a 32-bit register.

**Field descriptions**

The PMCIDR2 bit assignments are:

```
+---+---+---+---+
| 31| 8 | 7 | 0 |
+---+---+---+---+
   | RES0|     |
   +---+     |
       | PRMBL_2|
```

**Bits [31:8]**

- Reserved, RES0.

**PRMBL_2, bits [7:0]**

- Preamble. Must read as 0x05.

**Accessing the PMCIDR2:**

PMCIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF8</td>
</tr>
</tbody>
</table>
I3.3.10 PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

**Purpose**
Provides information to identify a Performance Monitor component.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**
PMCIDR3 is in the Debug power domain.
PMCIDR3 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**
PMCIDR3 is a 32-bit register.

**Field descriptions**
The PMCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8-0</td>
<td>PRMBL_3</td>
</tr>
</tbody>
</table>

**Bits [31:8]**
Reserved, RES0.

**PRMBL_3, bits [7:0]**
Preamble. Must read as 0xB1.

**Accessing the PMCIDR3:**
PMCIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFF</td>
</tr>
</tbody>
</table>
I3.3.11 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**
Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<x>. Reading this register shows which counters are enabled.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>

<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**
External register PMCNTENCLR_EL0 is architecturally mapped to AArch64 System register PMCNTENCLR_EL0.
External register PMCNTENCLR_EL0 is architecturally mapped to AArch32 System register PMCNTENCLR.
PMCNTENCLR_EL0 is in the Core power domain.

**Attributes**
PMCNTENCLR_EL0 is a 32-bit register.

**Field descriptions**
The PMCNTENCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;x&gt;, bit [x]</td>
<td></td>
</tr>
</tbody>
</table>

**C, bit [31]**
PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:
0 When read, means the cycle counter is disabled. When written, has no effect.
1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

**P<x>, bit [x], for x = 0 to 30**
Event counter disable bit for PMEVCNTR<x>.
Bits [30:N] are RAZ/WI. N is the value in PMCR_EL0.N.
Possible values of each bit are:
0 When read, means that PMEVCNTR<x> is disabled. When written, has no effect.
1 When read, means that PMEVCNTR<x> is enabled. When written, disables PMEVCNTR<x>. 
Accessing the PMCNTENCLR_EL0:

PMCNTENCLR_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC20</td>
</tr>
</tbody>
</table>
### I3.3.12 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<>. Reading this register shows which counters are enabled.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMCNTENSET_EL0 is architecturally mapped to AArch64 System register PMCNTENSET_EL0.

External register PMCNTENSET_EL0 is architecturally mapped to AArch32 System register PMCNTENSET.

PMCNTENSET_EL0 is in the Core power domain.

**Attributes**

PMCNTENSET_EL0 is a 32-bit register.

**Field descriptions**

The PMCNTENSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td></td>
<td>P&lt;&gt;, bit [x]</td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

0  When read, means the cycle counter is disabled. When written, has no effect.

1  When read, means the cycle counter is enabled. When written, enables the cycle counter.

**P<<>, bit [x], for x = 0 to 30**

Event counter enable bit for PMEVCNTR<>. Bits [30:N] are RAZ/WI. N is the value in PMCR_EL0.N.

Possible values of each bit are:

0  When read, means that PMEVCNTR<> is disabled. When written, has no effect.

1  When read, means that PMEVCNTR<> event counter is enabled. When written, enables PMEVCNTR<>.
Accessing the PMCNTENSEL0:

PMCNTENSEL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC00</td>
</tr>
</tbody>
</table>
I3.3.13 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

PMCR_EL0[6:0] are architecturally mapped to the corresponding bits of AArch64 register PMCR_EL0.

PMCR_EL0[6:0] are architecturally mapped to the corresponding bits of AArch32 register PMCR.

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

**Attributes**

PMCR_EL0 is a 32-bit register.

**Field descriptions**

The PMCR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>11</th>
<th>10</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ/WI</td>
<td>RES0</td>
<td>LCDP</td>
<td>X</td>
<td>D</td>
<td>C</td>
<td>P</td>
<td>E</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:11]**

Reserved, RAZ/WI.

**Bits [10:7]**

Reserved, RES0.

**LC, bit [6]**

Long cycle counter enable. Determines which PMCCNTR_EL0 bit generates an overflow recorded by PMOVS[31].

0 Cycle counter overflow on increment that changes PMCCNTR_EL0[31] from 1 to 0.
1 Cycle counter overflow on increment that changes PMCCNTR_EL0[63] from 1 to 0.

ARM deprecates use of PMCR_EL0.LC = 0.

In an AArch64-only implementation, this field is RES1.

**DP, bit [5]**

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

0 PMCCNTR_EL0, if enabled, counts when event counting is prohibited.
PMCCNTR_EL0 does not count when event counting is prohibited. Event counting is prohibited when ProfilingProhibited(IsSecure(),PSTATE_EL) == TRUE. This bit is RW. If EL3 is not implemented, this field is RES0.

X, bit [4]
Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:
0  Do not export events.
1  Export events where not prohibited.
This bit is used to permit events to be exported to another debug device, such as an OPTIONAL trace macrocell, over an event bus. If the implementation does not include such an event bus, this bit is RAZ/WI.
This bit does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE. If the implementation does not include an exported event stream, this bit is RAZ/WI. Otherwise this bit is RW.

D, bit [3]
Clock divider. The possible values of this bit are:
0  When enabled, PMCCNTR_EL0 counts every clock cycle.
1  When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.
This bit is RW.
If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.
ARM deprecates use of PMCR.D = 1.
In an AArch64-only implementation, this field is RES0.

C, bit [2]
Cycle counter reset. This bit is WO. The effects of writing to this bit are:
0  No action.
1  Reset PMCCNTR_EL0 to zero.
This bit is always RAZ.
Resetting PMCCNTR_EL0 does not clear the PMCCNTR_EL0 overflow bit to 0.

P, bit [1]
Event counter reset. This bit is WO. The effects of writing to this bit are:
0  No action.
1  Reset all event counters, not including PMCCNTR_EL0, to zero.
This bit is always RAZ.
Resetting the event counters does not clear any overflow bits to 0.

E, bit [0]
Enable. The possible values of this bit are:
0  All counters, including PMCCNTR_EL0, are disabled.
1  All counters are enabled by PMCNTENSET_EL0.
This bit is RW.
Accessing the PMCR_EL0:

PMCR_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE04</td>
</tr>
</tbody>
</table>
I3.3.14 PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

**Purpose**
Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**
PMDEVAFF0 is in the Debug power domain.
PMDEVAFF0 is optional to implement in the external register interface.

**Attributes**
PMDEVAFF0 is a 32-bit register.

**Field descriptions**
The PMDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPIDR_EL1 low half</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**
MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the PMDEVAFF0:**
PMDEVAFF0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFA8</td>
</tr>
</tbody>
</table>
I3.3.15 PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMDEVAFF1 is in the Debug power domain.

PMDEVAFF1 is optional to implement in the external register interface.

**Attributes**

PMDEVAFF1 is a 32-bit register.

**Field descriptions**

The PMDEVAFF1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPIDR_EL1 high half</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the PMDEVAFF1:**

PMDEVAFF1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFAC</td>
</tr>
</tbody>
</table>
I3.3.16 PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

**Purpose**

Identifies the programmers’ model architecture of the Performance Monitor component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMDEVARCH is in the Debug power domain.

PMDEVARCH is optional to implement in the external register interface.

**Attributes**

PMDEVARCH is a 32-bit register.

**Field descriptions**

The PMDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>REVISION</td>
<td>ARCHID</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For Performance Monitors, this is ARM Limited.

Bits [31:28] are the JEP 106 continuation code, 0x4.

Bits [27:21] are the JEP 106 ID code, 0x3B.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For Performance Monitors, the revision defined by ARMv8 is 0x0.

All other values are reserved.

**ARCHID, bits [15:0]**

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For Performance Monitors:

- Bits [15:12] are the architecture version, 0x2.
- Bits [11:0] are the architecture part number, 0xA16.
This corresponds to Performance Monitors architecture version PMUv3.

--- Note ---

The PMUv3 memory-mapped programmers' model can be used by devices other than ARMv8 processors. Software must determine whether the PMU is attached to an ARMv8 processor by using the PMDEVAFF0 and PMDEVAFF1 registers to discover the affinity of the PMU to any ARMv8 processors.

Accessing the PMDEVARcH:

PMDEVARcH can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFBC</td>
</tr>
</tbody>
</table>
I3.3.17 PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs performance monitor interface.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMDEVTYPE is in the Debug power domain.

PMDEVTYPE is optional to implement in the external register interface.

**Attributes**

PMDEVTYPE is a 32-bit register.

**Field descriptions**

The PMDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>SUB</td>
<td>MAJOR</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x6 to indicate this is a performance monitor component.

**Accessing the PMDEVTYPE:**

PMDEVTYPE can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFCC</td>
</tr>
</tbody>
</table>
### I3.3.18 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

External accesses to the performance monitors ignore PMUSERENR_EL0 and, if implemented, MDCR_EL2.[TPM, TPMCR, HPMN] and MDCR_EL3.TPM. This means that all counters are accessible regardless of the current EL or privilege of the access.

**Configurations**

External register PMEVCNTR<n>_EL0 is architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0.

External register PMEVCNTR<n>_EL0 is architecturally mapped to AArch32 System register PMEVCNTR<n>.

PMEVCNTR<n>_EL0 is in the Core power domain.

**Attributes**

PMEVCNTR<n>_EL0 is a 32-bit register.

**Field descriptions**

The PMEVCNTR<n>_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Event counter n</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
</tbody>
</table>

**Accessing the PMEVCNTR<n>_EL0:**

PMEVCNTR<n>_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x000 + 8n</td>
</tr>
</tbody>
</table>
I3.3.19 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMEVTYPER<n>_EL0 is architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0.

External register PMEVTYPER<n>_EL0 is architecturally mapped to AArch32 System register PMEVTYPER<n>.

PMEVTYPER<n>_EL0 is in the Core power domain.

**Attributes**

PMEVTYPER<n>_EL0 is a 32-bit register.

**Field descriptions**

The PMEVTYPER<n>_EL0 bit assignments are:

|-------------|-------------|---|------|----------|

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

0  Count events in EL1.
1  Do not count events in EL1.

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

0  Count events in EL0.
1  Do not count events in EL0.

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.
If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted. Otherwise, events in Non-secure EL1 are not counted.

**NSU, bit [28]**

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted. Otherwise, events in Non-secure EL0 are not counted.

**NSH, bit [27]**

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0  Do not count events in EL2.
1  Count events in EL2.

**M, bit [26]**

Secure EL3 filtering bit. Most applications can ignore this bit and set the value to zero. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Secure EL3 are counted. Otherwise, events in Secure EL3 are not counted.

**MT, bit [25]**

Multi-threading. If MPIDR_EL1.MT is set to 0, this bit is RES0. Otherwise valid values for this bit are:

0  Count events only on controlling PE.
1  Count events from any PE at the same level 0 affinity as this PE.

--- **Note** ---

Events from a different thread of a multi-threaded implementation are not attributable to the thread counting the event.

**Bits [24:10]**

Reserved, RES0.

**evtCount, bits [9:0]**

Event to count. The event number of the event that is counted by event counter PMEVCNTR<\text{<\text{n}>}_EL0. Software must program this field with an event defined by the processor or a common event defined by the architecture.

If evtCount is programmed to an event that is reserved or not implemented, the behavior depends on the event type.

For common architectural and microarchitectural events:

- No events are counted.
- The value read back on evtCount is the value written.

For IMPLEMENTATION DEFINED events:

- It is UNPREDICTABLE what event, if any, is counted. UNPREDICTABLE in this case means the event must not expose privileged information.
- The value read back on evtCount is an UNKNOWN value with the same effect.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.
Accessing the PMEVTYPER<n>_EL0:

PMEVTYPER<n>_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x400 + 4n</td>
</tr>
</tbody>
</table>
I3.3.20   PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<\text{x}>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMINTENCLR_EL1 is architecturally mapped to AArch64 System register PMINTENCLR_EL1.

External register PMINTENCLR_EL1 is architecturally mapped to AArch32 System register PMINTENCLR.

PMINTENCLR_EL1 is in the Core power domain.

**Attributes**

PMINTENCLR_EL1 is a 32-bit register.

**Field descriptions**

The PMINTENCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>C, bit [31]</th>
</tr>
</thead>
<tbody>
<tr>
<td>\text{PMCCNTR_EL0} overflow interrupt request disable bit. Possible values are:</td>
</tr>
<tr>
<td>0</td>
</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>P&lt;\text{x}&gt;, bit [x], for x = 0 to 30</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event counter overflow interrupt request disable bit for PMEVCNTR&lt;\text{x}&gt;_EL0.</td>
</tr>
<tr>
<td>N is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI. Possible values are:</td>
</tr>
<tr>
<td>0</td>
</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>
Accessing the PMINTENCLR_EL1:

PMINTENCLR_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC60</td>
</tr>
</tbody>
</table>
I3.3.21 PMINTENSEL_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSEL_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<\(x\)>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMINTENSEL_EL1 is architecturally mapped to AArch64 System register PMINTENSEL_EL1.

External register PMINTENSEL_EL1 is architecturally mapped to AArch32 System register PMINTENSEL.

PMINTENSEL_EL1 is in the Core power domain.

**Attributes**

PMINTENSEL_EL1 is a 32-bit register.

**Field descriptions**

The PMINTENSEL_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

C, bit [31]

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

0  When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

1  When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

P<\(x\)>, bit [x], for \(x = 0 \text{ to } 30\)

Event counter overflow interrupt request enable bit for PMEVCNTR<\(x\)>_EL0.

N is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI.

Possible values are:

0  When read, means that the PMEVCNTR<\(x\)>_EL0 event counter interrupt request is disabled. When written, has no effect.

1  When read, means that the PMEVCNTR<\(x\)>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<\(x\)>_EL0 interrupt request.
Accessing the PMINTENSET_EL1:

PMINTENSET_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC40</td>
</tr>
</tbody>
</table>
### I3.3.22 PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

**Purpose**
Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**
It is IMPLEMENTATION DEFINED whether PMITCTRL is in the Core power domain or in the Debug power domain.
PMITCTRL is optional to implement in the external register interface.

**Attributes**
PMITCTRL is a 32-bit register.

**Field descriptions**
The PMITCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>1</td>
<td>IME</td>
</tr>
</tbody>
</table>

**Bits [31:1]**
Reserved, RES0.

**IME, bit [0]**
Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

- 0 Normal operation.
- 1 Integration mode enabled.

When this register has an architecturally-defined reset value, this field resets to 0.
This field resets to its defined reset value on IMPLEMENTATION DEFINED reset.
Accessing the PMITCTRL:

PMITCTRL can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF00</td>
</tr>
</tbody>
</table>
I3 Memory-Mapped System Register Descriptions
I3.3 Performance Monitors memory-mapped register descriptions

I3.3.23   PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose
Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

Usage constraints
This register is accessible as follows:

Configurations
PMLAR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.
PMLAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.
The Software lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.
Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes
PMLAR is a 32-bit register.

Field descriptions
The PMLAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY</td>
<td></td>
</tr>
</tbody>
</table>

KEY, bits [31:0]
Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.
Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Accessing the PMLAR:
PMLAR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB0</td>
</tr>
</tbody>
</table>
I3.3.24 PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

PMLSR is in the Debug power domain.

If optional memory-mapped access to the external debug interface is supported then an optional Software lock can be implemented as part of CoreSight compliance.

PMLSR is RAZ if the Software lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

Field descriptions

The PMLSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| RES0 | SLI | SLK | nTT |

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

Software lock status for this component. For an access to LSR that is not a memory-mapped access, or when the software lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:

0 Lock clear. Writes are permitted to this component's registers.
Lock set. Writes to this component's registers are ignored, and reads have no side effects.

When this register has an architecturally-defined reset value, this field resets to 1.

This field resets to its defined reset value on External debug reset.

**SL1, bit [0]**

Software lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

0 Software lock not implemented or not memory-mapped access.

1 Software lock implemented and memory-mapped access.

**Accessing the PMLSR:**

PMLSR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB4</td>
</tr>
</tbody>
</table>
I3.3.25 PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<x>. Writing to this register clears these bits.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations

External register PMOVSCLR_EL0 is architecturally mapped to AArch64 System register PMOVSCLR_EL0.

External register PMOVSCLR_EL0 is architecturally mapped to AArch32 System register PMOVSR.

PMOVSCLR_EL0 is in the Core power domain.

Attributes

PMOVSCLR_EL0 is a 32-bit register.

Field descriptions

The PMOVSCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;x&gt;, bit [x]</td>
<td></td>
</tr>
</tbody>
</table>

C, bit [31]

PMCCNTR_EL0 overflow bit. Possible values are:

0 When read, means the cycle counter has not overflowed. When written, has no effect.
1 When read, means the cycle counter has overflowed. When written, clears the overflow bit to 0.

PMCR_EL0.LC is used to control from which bit of PMCCNTR_EL0 (bit 31 or bit 63) an overflow is detected.

P<x>, bit [x], for x = 0 to 30

Event counter overflow clear bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI. N is the value in PMCR_EL0.N.

Possible values of each bit are:

0 When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.
1 When read, means that PMEVCNTR<x> has overflowed. When written, clears the PMEVCNTR<x> overflow bit to 0.
Accessing the PMOVSCLR_EL0:

PMOVSCLR_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC80</td>
</tr>
</tbody>
</table>
I3.3.26  PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<x>.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMOVSSET_EL0 is architecturally mapped to AArch64 System register PMOVSSET_EL0.

External register PMOVSSET_EL0 is architecturally mapped to AArch32 System register PMOVSSET.

PMOVSSET_EL0 is in the Core power domain.

**Attributes**

PMOVSSET_EL0 is a 32-bit register.

**Field descriptions**

The PMOVSSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31 30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;x&gt;, bit [x]</td>
</tr>
</tbody>
</table>

- **C, bit [31]**
  
  PMCCNTR_EL0 overflow bit. Possible values are:

  0  When read, means the cycle counter has not overflowed. When written, has no effect.

  1  When read, means the cycle counter has overflowed. When written, sets the overflow bit to 1.

- **P<x>, bit [x], for x = 0 to 30**

  Event counter overflow set bit for PMEVCNTR<x>.

  Bits [30:N] are RAZ/WI. N is the value in PMCR_EL0.N.

  Possible values are:

  0  When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.

  1  When read, means that PMEVCNTR<x> has overflowed. When written, sets the PMEVCNTR<x> overflow bit to 1.
Accessing the PMOVSET_EL0:

PMOVSET_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCC0</td>
</tr>
</tbody>
</table>
I3.3.27 PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

PMPIDR0 is in the Debug power domain.
PMPIDR0 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions

The PMPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PART_0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

Accessing the PMPIDR0:

PMPIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE0</td>
</tr>
</tbody>
</table>
I3.3.28 PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

PMPIDR1 is in the Debug power domain.
PMPIDR1 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

Attributes

PMPIDR1 is a 32-bit register.

Field descriptions

The PMPIDR1 bit assignments are:

```
<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>DES_0</td>
<td>PART_1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is \(0b1011\).

PART_1, bits [3:0]

Part number, most significant nibble.

Accessing the PMPIDR1:

PMPIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE4</td>
</tr>
</tbody>
</table>
I3.3.29 PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

- PMPIDR2 is in the Debug power domain.
- PMPIDR2 is optional to implement in the external register interface.
- This register is required for CoreSight compliance.

**Attributes**

- PMPIDR2 is a 32-bit register.

**Field descriptions**

The PMPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>REVISION</td>
<td>DES_1</td>
<td>JEDEC</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

- Reserved, RES0.

**REVISION, bits [7:4]**

- Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

- RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

- Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is 0b011.

**Accessing the PMPIDR2:**

PMPIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE8</td>
</tr>
</tbody>
</table>
### I3.3.30 PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

#### Purpose
Provides information to identify a Performance Monitor component.

#### Usage constraints
This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

#### Configurations
PMPIDR3 is in the Debug power domain.
PMPIDR3 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

#### Attributes
PMPIDR3 is a 32-bit register.

#### Field descriptions
The PMPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8:7</td>
<td>REVAND</td>
</tr>
<tr>
<td>4:0</td>
<td>CMOD</td>
</tr>
</tbody>
</table>

- **Bits [31:8]**
  - Reserved, RES0.
- **REVAND, bits [7:4]**
  - Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.
- **CMOD, bits [3:0]**
  - Customer modified. Indicates someone other than the Designer has modified the component.

#### Accessing the PMPIDR3:

PMPIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFEC</td>
</tr>
</tbody>
</table>
I3.3.31 PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMPIDR4 is in the Debug power domain.

PMPIDR4 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR4 is a 32-bit register.

**Field descriptions**

The PMPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RES0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>SIZE</td>
<td></td>
<td>DES_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. \( \text{RAZ, } \log_2(\text{number of 4KB pages from the start of the component to the end of the component ID registers}) \).

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is 0b0100.

**Accessing the PMPIDR4:**

PMPIDR4 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFD0</td>
</tr>
</tbody>
</table>
### I3.3.32 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>WI</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Configurations**

External register PMSWINC_EL0 is architecturally mapped to AArch64 System register PMSWINC_EL0.

External register PMSWINC_EL0 is architecturally mapped to AArch32 System register PMSWINC.

PMSWINC_EL0 is in the Core power domain.

PMSWINC_EL0 is optional to implement in the external register interface.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [x] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter x. This is consistent with not implementing the register in the external debug interface.

**Attributes**

PMSWINC_EL0 is a 32-bit register.

**Field descriptions**

The PMSWINC_EL0 bit assignments are:

- **Bit [31]**
  - Reserved, RES0.
- **P<x>, bit [x]**
  - Event counter software increment bit for PMEVCNTR<x>.
  - P<x> is WI if x >= PMCR_EL0.N, the number of implemented counters.
  - Otherwise, the effects of writing to this bit are:
    - 0: No action. The write to this bit is ignored.
    - 1: It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter x.
Accessing the PMSWINC_EL0:

PMSWINC_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCA0</td>
</tr>
</tbody>
</table>
I3.4  Generic Timer memory-mapped registers overview

The Generic Timer memory-mapped registers are implemented as multiple register frames, with each register frame having its own base address, as follows:

- A single CNTCTLB register frame, at base address CNTCTLB.
- Between one and seven CNTB registers, each with its own base address CNTB.
- For each CNTB register frame, if required, a CNETLB register frame, at base address CNETLB, that provides an EL0 view of the CNTB register frame.

For more information, see:

- Memory-mapped timer components on page I1-5256.
- The CNTB and CNETLB frames on page I1-5257. This section includes the memory map of the CNTB and CNTB register frames.
- The CNTCTLB frame on page I1-5259. This section includes the memory map of the CNTCTLB register frame.
- Providing a complete set of counter and timer features on page I1-5260.
I3.5  Generic Timer memory-mapped register descriptions

This section describes the Generic Timer registers. Generic Timer memory-mapped registers overview on page 13-5324 gives an overview of these registers, and includes links to their memory maps.
### I3.5.1 CNTACR<\(n\)>, Counter-timer Access Control Registers, \(n = 0 - 7\)

The CNTACR<\(n\)> characteristics are:

**Purpose**

Provides top-level access controls for the elements of a timer frame. CNTACR<\(n\)> provides the controls for frame CNTBaseN.

In addition to the CNTACR<\(n\)> control:
- CNTNSAR controls whether CNTACR<\(n\)> is accessible from Non-secure state.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

In a system that implements both Secure and Non-secure states:
- CNTACR<\(n\)> is always accessible in Secure state.
- CNTNSAR.NS<\(n\)> determines whether CNTACR<\(n\)> is accessible in Non-secure state.

**Configurations**

Implemented only if CNTTIDR.FI<\(n\)> is RAO.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<\(n\)> register is:
- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

**Attributes**

CNTACR<\(n\)> is a 32-bit register.

**Field descriptions**

The CNTACR<\(n\)> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

Bits [31:6] Reserved, RES0.
RWPT, bit [5]
Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame \(<n>\). The possible values of this bit are:

0  No access to the EL1 Physical Timer registers in frame \(<n>\). The registers are RES0.
1  Read/write access to the EL1 Physical Timer registers in frame \(<n>\).

RWVT, bit [4]
Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame \(<n>\). The possible values of this bit are:

0  No access to the Virtual Timer registers in frame \(<n>\). The registers are RES0.
1  Read/write access to the Virtual Timer registers in frame \(<n>\).

RVOFF, bit [3]
Read-only access to CNTVOFF, in frame \(<n>\). The possible values of this bit are:

0  No access to CNTVOFF in frame \(<n>\). The register is RES0.
1  Read-only access to CNTVOFF in frame \(<n>\).

RFRQ, bit [2]
Read-only access to CNTFRQ, in frame \(<n>\). The possible values of this bit are:

0  No access to CNTFRQ in frame \(<n>\). The register is RES0.
1  Read-only access to CNTFRQ in frame \(<n>\).

RVCT, bit [1]
Read-only access to CNTVCT, in frame \(<n>\). The possible values of this bit are:

0  No access to CNTVCT in frame \(<n>\). The register is RES0.
1  Read-only access to CNTVCT in frame \(<n>\).

RPCT, bit [0]
Read-only access to CNTPCT, in frame \(<n>\). The possible values of this bit are:

0  No access to CNTPCT in frame \(<n>\). The register is RES0.
1  Read-only access to CNTPCT in frame \(<n>\).

Accessing the CNTACR\(<n>\):
CNTACR\(<n>\) can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x040 + 4n</td>
</tr>
</tbody>
</table>
### I3.5.2 CNTCR, Counter Control Register

The CNTCR characteristics are:

**Purpose**

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

In a system that implements both Secure and Non-secure states, this register is only writable in Secure state.

**Configurations**

There are no configuration notes.

**Attributes**

CNTCR is a 32-bit register.

**Field descriptions**

The CNTCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>FCREQ</td>
<td>Frequency change request. Indicates the number of the entry in the frequency table to select. Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter. When this register has an architecturally-defined reset value, this field resets to 0.</td>
</tr>
<tr>
<td>7</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>EN</td>
<td>Enables the counter:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0     System counter disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1     Asserted Halt-on-debug signal halts system counter update.</td>
</tr>
</tbody>
</table>

**HDBG, bit [1]**

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>HDBG</td>
<td>Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0     System counter ignores Halt-on-debug.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1     Asserted Halt-on-debug signal halts system counter update.</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**EN, bit [0]**

Enables the counter:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EN</td>
<td>Enables the counter:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0     System counter disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1     Asserted Halt-on-debug signal halts system counter update.</td>
</tr>
</tbody>
</table>

In a system that implements both Secure and Non-secure states, this register is only writable in Secure state.
System counter enabled. When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the CNTCR:**

CNTCR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x00</td>
</tr>
</tbody>
</table>
I3.5.3 CNTCV, Counter Count Value register

The CNTCV characteristics are:

**Purpose**
Indicates the current count value.

**Usage constraints**
This register is accessible as follows:

| Default | RW in CNTControlBase, RO in CNTReadBase |

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

This register can be read in both the CNTControlBase and CNTReadBase frames, but can only be written in the CNTControlBase frame.

For the writable copy of the register:
- If the counter is enabled, the effect if writing the register is UNPREDICTABLE.
- If the system implements both Secure and Non-secure states, the register is writable only by Secure writes.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

**Configurations**
There are no configuration notes.

**Attributes**
CNTCV is a 64-bit register.

**Field descriptions**
The CNTCV bit assignments are:

63          0
\[ \begin{array}{c}
| CountValue |
\end{array} \]

**CountValue, bits [63:0]**
Indicates the counter value.

**Accessing the CNTCV:**
CNTCV[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x008</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0x000</td>
</tr>
</tbody>
</table>
CNTCV[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x00C</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0x004</td>
</tr>
</tbody>
</table>
I3.5.4 CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

**Purpose**

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, and CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

**Configurations**

CNTEL0ACR is optional to implement in the external register interface. In each implemented CNTBaseN frame, CNTEL0ACR is optional. If it is not implemented:

- Its location is RAZ/WI.
- The registers it controls are not visible in the corresponding CNTEL0BaseN frame.

**Attributes**

CNTEL0ACR is a 32-bit register.

**Field descriptions**

The CNTEL0ACR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>10</th>
<th>9</th>
<th>8</th>
<th>7</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
<td>EL0PCTEN</td>
<td>EL0VCTEN</td>
<td>EL0VTEN</td>
<td>EL0OPTEN</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:10]**

Reserved, RES0.

**EL0OPTEN, bit [9]**

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

- 0: No access. Registers are RES0 in the second view.
- 1: Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.
**EL0VTEN, bit [8]**
Second view read/write access control for the Virtual Timer registers. This bit controls whether the `CNTV_CVAL`, `CNTV_TVAL`, and `CNTV_CTL` registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

- **0**: No access. Registers are RES0 in the second view.
- **1**: Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

**Bits [7:2]**
Reserved, RES0.

**EL0VCTEN, bit [1]**
Second view read access control for `CNTVCT` and `CNTFRQ`. The possible values of this bit are:

- **0**: `CNTVCT` is not visible in the second view.
  - If EL0PCTEN is set to 0, `CNTFRQ` is not visible in the second view.
- **1**: Access permitted. If `CNTVCT` and `CNTFRQ` are visible in the current frame then they are visible in the second view.

**EL0PCTEN, bit [0]**
Second view read access control for `CNTPCT` and `CNTFRQ`. The possible values of this bit are:

- **0**: `CNTPCT` is not visible in the second view.
  - If EL0VCTEN is set to 0, `CNTFRQ` is not visible in the second view.
- **1**: Access permitted. If `CNTPCT` and `CNTFRQ` are visible in the current frame then they are visible in the second view.

**Accessing the CNTEL0ACR:**
CNTEL0ACR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x014</td>
</tr>
</tbody>
</table>
I3.5.5 CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

**Purpose**

Indicates the base frequency of the system counter.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO or RW</th>
</tr>
</thead>
</table>

**Configurations**

The possible frequencies for the system counter are stored as 32-bit words starting with the base frequency, CNTFID0.

A 32-bit word of zero value after the final frequency mode entry marks the end of the frequency modes table.

Typically, the frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialise the table entries as part of its start-up sequence.

If the frequency modes table is in read/write memory, ARM strongly recommends that the frequency modes table is not updated once the system is running.

**Attributes**

CNTFID0 is a 32-bit register.

**Field descriptions**

The CNTFID0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td></td>
</tr>
</tbody>
</table>

**Frequency, bits [31:0]**

The base frequency of the system counter, in Hz.

**Accessing the CNTFID0:**

CNTFID0 can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020</td>
</tr>
</tbody>
</table>
I3.5.6 CNTFID<\textit{n}>, Counter Frequency IDs, \textit{n} = 1 - 23

The CNTFID<\textit{n}> characteristics are:

**Purpose**
Indicates alternative system counter update frequencies.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO or RW</th>
</tr>
</thead>
</table>

**Configurations**
CNTFID<\textit{n}> is optional to implement in the external register interface.

The possible frequencies for the system counter are stored as 32-bit words starting with the base frequency, CNTFID0.

A 32-bit word of zero value after the final frequency mode entry marks the end of the frequency modes table. The only required entry in the table is the entry for CNTFID0.

Typically, the frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialise the table entries as part of its start-up sequence.

If the frequency modes table is in read/write memory, ARM strongly recommends that the frequency modes table is not updated once the system is running.

**Attributes**
CNTFID<\textit{n}> is a 32-bit register.

**Field descriptions**
The CNTFID<\textit{n}> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td></td>
</tr>
</tbody>
</table>

**Frequency, bits [31:0]**
A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. ARM strongly recommends that all frequency values in the table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

\[
\text{increment} = \frac{\text{base frequency}}{\text{selected frequency}}
\]

**Accessing the CNTFID<\textit{n}>**:
CNTFID<\textit{n}> can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020 + 4n</td>
</tr>
</tbody>
</table>
I3 Memory-Mapped System Register Descriptions
I3.5 Generic Timer memory-mapped register descriptions

I3.5.7 CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

Holds the clock frequency of the system counter.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

In a system that implements both Secure and Non-secure states, this register is only accessible in Secure state.

Configurations

There are no configuration notes.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

The CNTFRQ bit assignments are:

<table>
<thead>
<tr>
<th>Clock frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 0</td>
</tr>
</tbody>
</table>

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

Accessing the CNTFRQ:

CNTFRQ can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x010</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTELOBaseN</td>
<td>0x010</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x000</td>
</tr>
</tbody>
</table>
I3.5.8 CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

In a system that implements both Secure and Non-secure states, this register is only accessible in Secure state.

Configurations

There are no configuration notes.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

The CNTNSAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

NS<n>, bit [n], for n = 0 to 7

Non-secure access to frame n. The possible values of this bit are:

0 Secure access only. Behaves as RES0 to Non-secure accesses.
1 Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
• Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<\n> is RES1.

**Accessing the CNTNSAR:**

CNTNSAR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTRLBase</td>
<td>0x004</td>
</tr>
</tbody>
</table>
I3.5.9 CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

**Purpose**

Control register for the physical timer.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

CNTACR<n>.RWPT enables access to this register in frame <n>.

**Configurations**

There are no configuration notes.

**Attributes**

CNTP_CTL is a 32-bit register.

**Field descriptions**

The CNTP_CTL bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ENABLE | IMASK | ISTATUS |
```

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

- 0 Timer condition is not asserted.
- 1 Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers on page D6-1897* and *Operation of the TimerValue views of the timers on page D6-1898*.

This bit is read-only.

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

- 0 Timer output signal is not masked.
- 1 Timer output signal is masked.
For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

- **0** Timer disabled.
- **1** Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.

--- Note ---

Disabling the output signal might be a power-saving option.

**Accessing the CNTP_CTL:**

CNTP_CTL can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x02C</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x02C</td>
</tr>
</tbody>
</table>
I3.5.10 CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the EL1 physical timer.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

CNTACR<\text{n}>.RWPT enables access to this register in frame \text{<\text{n}>}.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

**Configurations**

There are no configuration notes.

**Attributes**

CNTP_CVAL is a 64-bit register.

**Field descriptions**

The CNTP_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-0</td>
<td>EL1 physical timer compare value</td>
</tr>
</tbody>
</table>

**Accessing the CNTP_CVAL:**

CNTP_CVAL[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x020</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x024</td>
</tr>
</tbody>
</table>

CNTP_CVAL[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x024</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x024</td>
</tr>
</tbody>
</table>
I3.5.11  **CNTP_TVAL, Counter-timer Physical Timer TimerValue**

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer. This provides a 32-bit downcounter.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

**CNTACR<n>.RWPT** enables access to this register in frame <n>.

**Configurations**

There are no configuration notes.

**Attributes**

CNTP_TVAL is a 32-bit register.

**Field descriptions**

The CNTP_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>EL1 physical timer value</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

EL1 physical timer value.

**Accessing the CNTP_TVAL:**

CNTP_TVAL can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x028</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x028</td>
</tr>
</tbody>
</table>
### I3.5.12 CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

CNTACR<\(n\)>RPCT enables access to this register in frame \(<n\>\).

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

**Configurations**

There are no configuration notes.

**Attributes**

CNTPCT is a 64-bit register.

**Field descriptions**

The CNTPCT bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Physical count value</th>
</tr>
</thead>
</table>

**Accessing the CNTPCT:**

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x000</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x000</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x004</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x004</td>
</tr>
</tbody>
</table>
I3.5.13   CNTSR, Counter Status Register

The CNTSR characteristics are:

**Purpose**

Provides counter frequency status information.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

There are no configuration notes.

**Attributes**

CNTSR is a 32-bit register.

**Field descriptions**

The CNTSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>FCACK</td>
</tr>
<tr>
<td>8</td>
<td>RES0</td>
</tr>
<tr>
<td>7</td>
<td>reserved, RES0</td>
</tr>
<tr>
<td>2</td>
<td>DBGH</td>
</tr>
</tbody>
</table>

**FCACK, bits [31:8]**

Frequency change acknowledge. Indicates the currently selected entry in the frequency table.
When this register has an architecturally-defined reset value, this field resets to 0.

**Bits [7:2]**

Reserved, RES0.

**DBGH, bit [1]**

Indicates whether the counter is halted because the Halt-on-Debug signal is asserted:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Counter is not halted.</td>
</tr>
<tr>
<td>1</td>
<td>Counter is halted.</td>
</tr>
</tbody>
</table>

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**Bit [0]**

Reserved, RES0.
Accessing the CNTSR:
CNTSR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x004</td>
</tr>
</tbody>
</table>
### I3.5.14 CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

**Purpose**

Indicates the implemented timers in the memory map, and their features. For each value of \( N \) from 0 to 7 it indicates whether:

- Frame CNTBase\( N \) is a view of an implemented timer.
- Frame CNTBase\( N \) has a second view, CNTEL0Base\( N \).
- Frame CNTBase\( N \) has a virtual timer capability.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

There are no configuration notes.

**Attributes**

CNTTIDR is a 32-bit register.

**Field descriptions**

The CNTTIDR bit assignments are:

<table>
<thead>
<tr>
<th>Frame7</th>
<th>Frame6</th>
<th>Frame5</th>
<th>Frame4</th>
<th>Frame3</th>
<th>Frame2</th>
<th>Frame1</th>
<th>Frame0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>28</td>
<td>27</td>
<td>24</td>
<td>23</td>
<td>20</td>
<td>19</td>
<td>16</td>
</tr>
</tbody>
</table>

Frame\( \langle n \rangle \), bits \([4n+3:4n]\), for \( n = 0 \) to 7

A 4-bit field indicating the features of frame CNTBase\( \langle n \rangle \).

Bit[3] of the field is RES0.

Bit[2] indicates whether frame CNTBase\( \langle n \rangle \) has a second view, CNTEL0Base\( \langle n \rangle \). The possible values of this bit are:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Frame ( \langle n \rangle ) does not have a second view. CNTEL0Base( \langle n \rangle ) is RES0.</td>
</tr>
<tr>
<td>1</td>
<td>Frame ( \langle n \rangle ) has a second view, CNTEL0Base( \langle n \rangle ).</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[2] is RES0.

Bit[1] indicates whether both:

- Frame CNTBase\( \langle n \rangle \) implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF\( \langle n \rangle \).
The possible values of bit[1] are:

<table>
<thead>
<tr>
<th>Bit[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Frame (&lt;n&gt;) does not have virtual capability. The virtual time and offset registers are RES0.</td>
</tr>
<tr>
<td>1</td>
<td>Frame (&lt;n&gt;) has virtual capability. The virtual time and offset registers are implemented.</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[1] is RES0.

Bit[0] indicates whether frame \(<n>\) is implemented. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Bit[0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Frame (&lt;n&gt;) not implemented. All registers associated with the frame are RES0.</td>
</tr>
<tr>
<td>1</td>
<td>Frame (&lt;n&gt;) is implemented.</td>
</tr>
</tbody>
</table>

**Accessing the CNTTIDR:**

CNTTIDR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLB</td>
<td>0x008</td>
</tr>
</tbody>
</table>
I3.5.15 CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

**Purpose**
Control register for the virtual timer.

**Usage constraints**
This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

Bit [1] of CNTTIDR.Frame<n> indicates whether CNTV_CTL is implemented for frame <n>. If CNTV_CTL is implemented, CNTACR<n>.RWVT enables access to the register in frame <n>. If CNTV_CTL is not implemented, the register location is RAZ/WI.

**Configurations**
CNTV_CTL is optional to implement in the external register interface.

**Attributes**
CNTV_CTL is a 32-bit register.

**Field descriptions**
The CNTV_CTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| RES0 |

**Bits [31:3]**
Reserved, RES0.

**ISTATUS, bit [2]**
The status of the timer. This bit indicates whether the timer condition is asserted:
0 Timer condition is not asserted.
1 Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers* on page D6-1897 and *Operation of the TimerValue views of the timers* on page D6-1898.

This bit is read-only.
IMASK, bit [1]
Timer output signal mask bit. Permitted values are:
0   Timer output signal is not masked.
1   Timer output signal is masked.
For more information, see the description of the ISTATUS bit.

ENABLE, bit [0]
Enables the timer. Permitted values are:
0   Timer disabled.
1   Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

Note
Disabling the output signal might be a power-saving option.

Accessing the CNTV_CTL:
CNTV_CTL can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x03C</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x03C</td>
</tr>
</tbody>
</table>
### I3.5.16  CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the virtual timer.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

Bit [1] of CNTTIDR.Frame<n> indicates whether CNTV_CVAL is implemented for frame <n>. If CNTV_CVAL is implemented, CNTACR<n>.RWVT enables access to the register in frame <n>. If CNTV_CVAL is not implemented, the register location is RAZ/WI. If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

**Configurations**

CNTV_CVAL is optional to implement in the external register interface.

**Attributes**

CNTV_CVAL is a 64-bit register.

**Field descriptions**

The CNTV_CVAL bit assignments are:

#### Bits [63:0]

Virtual timer compare value.

**Accessing the CNTV_CVAL:**

CNTV_CVAL[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x030</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x030</td>
</tr>
</tbody>
</table>
CNTV_CVAL[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x034</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTELOBaseN</td>
<td>0x034</td>
</tr>
</tbody>
</table>
I3.5.17  CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bit [1] of CNTTIDR.Frame<\(n\)> indicates whether CNTV_TVAL is implemented for frame \(<n>\).
If CNTV_TVAL is implemented, CNTACR<\(n\)>_RWVT enables access to the register in frame \(<n>\).
If CNTV_TVAL is not implemented, the register location is RAZ/WI.

**Configurations**

CNTV_TVAL is optional to implement in the external register interface.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

The CNTV_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Virtual timer value**

Bits [31:0]

Virtual timer value.

**Accessing the CNTV_TVAL:**

CNTV_TVAL can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x038</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTELOBaseN</td>
<td>0x038</td>
</tr>
</tbody>
</table>
I3.5.18 CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Usage constraints

This register is accessible as follows:

CNTACR\<n>.RVCT enables access to this register in frame \(<n>\).

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

Configurations

There are no configuration notes.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

The CNTVCT bit assignments are:

63 0

Virtual count value

| Bits [63:0] | Virtual count value |

Accessing the CNTVCT:

CNTVCT[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x008</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x008</td>
</tr>
</tbody>
</table>

CNTVCT[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x00C</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x00C</td>
</tr>
</tbody>
</table>
### I3.5.19 CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

If the implementation supports 64-bit atomic accesses, then the CNTVOFF register must be accessible as an atomic 64-bit value.

**Configurations**

CNTACR<n>.RVOFF enables access to this register for frame CNTBase<n>.

**Attributes**

CNTVOFF is a 64-bit register.

**Field descriptions**

The CNTVOFF bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual offset</th>
</tr>
</thead>
</table>

**Accessing the CNTVOFF:**

CNTVOFF[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x018</td>
</tr>
</tbody>
</table>

CNTVOFF[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x01C</td>
</tr>
</tbody>
</table>
I3.5.20 CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

**Purpose**

Holds the 64-bit virtual offset for frame CNTBase<n>.

**Usage constraints**

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

If the implementation supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

In a system that implements both Secure and Non-secure states:
- CNTVOFF<n> is always accessible in Secure state.
- CNTNSAR.NS<n> determines whether CNTVOFF<n> is accessible in Non-secure state.

**Configurations**

CNTVOFF<n> is optional to implement in the external register interface.

CNTVOFF<n> is accessible in the CNTCTLB base register map if CNTACR<n>.RVOFF is 1 and bit [1] of CNTTIDR.Frame<n> is 1.

If bit [1] of CNTTIDR.Frame<n> is 0, or CNTACR<n>.RVOFF is 1, CNTVOFF<n> is RAZ/WI.

**Attributes**

CNTVOFF<n> is a 64-bit register.

**Field descriptions**

The CNTVOFF<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Virtual offset</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Virtual offset.

**Accessing the CNTVOFF<n>**:

CNTVOFF<n>[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLB</td>
<td>0x80 + 8n</td>
</tr>
</tbody>
</table>
CNTVOFF<\text{n}\>[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x884 + 8n</td>
</tr>
</tbody>
</table>
CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Usage constraints

This register is accessible as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

Configurations

These registers are implemented independently in each of the frames accessed through the different memory maps.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the ARM Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions

The CounterID<n> bit assignments are:

31 0

IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the CounterID<n>:

CounterID<n> can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>

Architectural Constraints on UNPREDICTABLE behaviors

This chapter describes the architectural constraints on UNPREDICTABLE behaviors in the ARMv8 architecture. It contains the following sections:

- AArch32 CONSTRAINED UNPREDICTABLE behaviors on page J1-5362.
- Constraints on AArch64 state UNPREDICTABLE behaviors on page J1-5440.
J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

ARMv8 defines architecturally-required constraints on many behaviors that are UNPREDICTABLE in ARMv7. The following sections define those constraints:

- **Overview of the constraints on ARMv7 UNPREDICTABLE behaviors** on page J1-5363.
- **Using R13** on page J1-5363.
- **Using R15** on page J1-5363.
- **Branching into an IT block** on page J1-5364.
- **Branching to an unaligned PC** on page J1-5364.
- **Loads and Stores to unaligned locations** on page J1-5364.
- **CONSTRAINED UNPREDICTABLE instructions in an IT block** on page J1-5365.
- **Unallocated CP14 and CP15 instructions** on page J1-5366.
- **SBZ or SBO fields in instructions** on page J1-5366.
- **Immediate constants in T32 data processing instructions** on page J1-5366.
- **Unallocated values in register fields of CP14 and CP15 registers and translation table entries** on page J1-5367.
- **CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values** on page J1-5367.
- **CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization** on page J1-5367.
- **Translation Table Base Address alignment** on page J1-5367.
- **Handling of conceptual coprocessors CP10 and CP11** on page J1-5368.
- **Performance Monitors Extension** on page J1-5368.
- **Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED** on page J1-5370.
- **Out of range virtual address** on page J1-5370.
- **Instruction fetches from Device memory** on page J1-5370.
- **Multi-access instructions that load the PC from Device memory** on page J1-5370.
- **Programming CSSELR.Level for a cache level that is not implemented** on page J1-5371.
- **Crossing a page boundary with different memory types or shareability attributes** on page J1-5371.
- **Crossing a 4KB boundary with a Device access** on page J1-5371.
- **CONSTRAINED UNPREDICTABLE behavior for memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions** on page J1-5372.
- **Out of range values of the Set/Way/Index fields in cache maintenance instructions** on page J1-5372.
- **CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instructions in the base instruction set** on page J1-5372.
- **CONSTRAINED UNPREDICTABLE behavior for A32 and T32 system instructions in the base instruction set** on page J1-5417.
- **CONSTRAINED UNPREDICTABLE behavior, A32 and T32 Advanced SIMD and floating-point instructions** on page J1-5424.
- CONSTRANGED UNPREDICTABLE behaviors associated with the VTCR on page J1-5435.
- CONSTRANGED UNPREDICTABLE behavior in Debug state on page J1-5435.
- CONSTRANGED UNPREDICTABLE behavior of EL2 features on page J1-5436.

J1.1.1 Overview of the constraints on ARMv7 UNPREDICTABLE behaviors

The term UNPREDICTABLE describes a number of cases where the architecture has a feature that software must not use. For execution in AArch32 state, where previous versions of the architecture define behavior as UNPREDICTABLE, the ARMv8-A architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRANGED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRANGED UNPREDICTABLE behavior.

Note
Software designed to be compatible with the ARMv8-A architecture must not rely on these CONSTRANGED UNPREDICTABLE cases.

J1.1.2 Using R13

In prior versions of the architecture, the use of R13 as a named register specifier was described as UNPREDICTABLE in the pseudocode. In the ARMv8-A architecture, the use of R13 as a named register specifier is not UNPREDICTABLE, unless this is specifically stated, and R13 can be used in the regular form. Bits[1:0] of R13 are not treated as RES0, but can hold any values programmed into them.

J1.1.3 Using R15

All uses of R15 as a named register specifier for a source register that are described as CONSTRANGED UNPREDICTABLE in the pseudocode or in other places in this reference manual can do one of the following:

- Cause the instruction to be treated as an UNDEFINED instruction.
- Cause the instruction to execute as a NOP.
- Read the PC with the standard offset that applies for the current instruction set.
- Read the PC with the standard offset that applies for the current instruction set with alignment to a word boundary.
- Read 0.
- Read an UNKNOWN value.

All uses of R15 as a named register specifier for a destination register that are described as CONSTRANGED UNPREDICTABLE in the pseudocode or in other places in this reference manual can do one of the following:

- Cause the instruction to be treated as UNDEFINED.
- Cause the instruction to execute as a NOP.
- Ignore the write.
- Branch to an UNKNOWN location in either A32 or T32 state.

The choice between these behaviors might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

Instructions that are CONSTRANGED UNPREDICTABLE when the base register is R15 and the instruction specifies a writeback of the base register, are treated as having R15 as both a source register and a destination register.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors

J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

For instructions that have two destination registers, for example LDRD, MRRC, and many of the multiply instructions, if Rt, Rt2, RdLo, or RdHi is R15, then the other destination register of the pair is UNKNOWN, if the CONSTRAINED UNPREDICTABLE behavior for the write to R15 is either to ignore the write or to branch to an UNKNOWN location.

For instructions that affect any or all of PSTATE.{N, Z, C, V}, PSTATE.Q, and PSTATE.GE when the register specifier is not R15, any flags affected by an instruction that is CONSTRAINED UNPREDICTABLE when the register specifier is R15 become UNKNOWN.

In addition, for MRC instructions for CP14 and CP15 that use R15 as the destination register descriptor, and thereby target APSR_nzcv where these are described as being CONSTRAINED UNPREDICTABLE, PSTATE.{N, Z, C, V} becomes UNKNOWN.

J1.1.4 Branching into an IT block

Branching into an IT block leads to CONSTRAINED UNPREDICTABLE behavior. Execution starts from the address determined by the branch, but each instruction in the IT block is:

- Executed as if it were not in an IT block. This means that it is executed unconditionally.
- Executed as if it had passed its Condition code check within an IT block.
- Executed as a NOP. That is, it behaves as if it had failed the Condition code check.

J1.1.5 Branching to an unaligned PC

In A32 state, when branching to an address that is not word aligned and is defined to be CONSTRAINED UNPREDICTABLE, one of the following behaviors can occur:

- The unaligned location is forced to be aligned.
- The unaligned address generates an exception on the first instruction using the unaligned PC value. If that instruction is executed at EL0 and either of the following applies, the exception is taken to EL2:
  - EL2 is using AArch32 and the value of HCR.TGE is 1
  - EL2 is using AArch64 and the value of HCR_EL2.TGE is 1.
- If the instruction is executed at EL0 when the applicable TGE bit is 0 the exception is taken to EL1.
- If the instruction is executed at an Exception level that is higher than EL0 the exception is taken to the Exception level at which the instruction was executed.
- In all cases, the exception is generated only if the first instruction using the unaligned PC value is architecturally executed.

If the exception that results from a branch to an unaligned PC value:

- Is taken to an Exception level that is using AArch64, it is reported as a Misaligned PC exception, see Exception from an illegal Execution State, misaligned PC, or misaligned stack pointer on page D1-1527.
- Is taken to an Exception level that is using AArch32, it is reported as a Prefetch Abort exception, see Prefetch Abort exception reporting a Misaligned PC exception on page G1-3885.

**Note**

Because bit[0] is used for interworking, it is impossible to specify a branch to A32 state when the bottom bit of the target address is 1. Therefore the bottom bit of IFAR, HIFAR, or FAR_ELx is 0 for all these cases.

J1.1.6 Loads and Stores to unaligned locations

Some unaligned loads and stores in the ARMv7 architecture are described as UNPREDICTABLE. These are defined in the ARMv8-A architecture to do one of the following:

- Take an alignment fault.
- Perform the specified load or store to the unaligned memory location.
### J1.1.7 CONSTRAINED UNPREDICTABLE instructions in an IT block

A number of instructions in the architecture are described as being CONSTRAINED UNPREDICTABLE either:

- Anywhere within an IT block.
- As an instruction within an IT block, other than the last instruction within an IT block.

Unless otherwise stated in this manual, when these instructions are committed for execution, one of the following occurs:

- An UNDEFINED exception results.
- The instructions are executed as if they had passed the Condition code check.
- The instructions execute as NOPs. This means that they behave as if they had failed the Condition code check.

The behavior might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

Many instructions that are CONSTRAINED UNPREDICTABLE in an IT block are branch instructions or other non-sequential instructions that change the PC. Where these instructions are not treated as UNDEFINED within an IT block, the remaining iterations of the PSTATE.IT state machine can be treated as follows:

- PSTATE.IT can be cleared.
- PSTATE.IT can advance for either a sequential or a nonsequential change of the PC in the same way as it does for instructions that are not CONSTRAINED UNPREDICTABLE that cause a sequential change of the PC.

**Note**

This does not apply to an instruction that is the last instruction in an IT block.

The instructions addressed by the updated PC can:

- Execute as if they had passed the Condition code check for the remaining iterations of the PSTATE.IT state machine.
- Execute as NOPs. That is, they behave as if they had failed the Condition code check for the remaining iterations of the PSTATE.IT state machine.
- Execute as if they were unconditional, or, if the instructions are part of another IT block, in accordance with the behavior described in *Branching into an IT block* on page J1-5364.

The behavior might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

For exception returns or Debug state exits that cause PSTATE.IT to be set to a reserved value in T32 state or that return to A32 state with a nonzero value in PSTATE.IT, the PSTATE.IT bits are forced to ‘00000000’.

The reserved values are:

```plaintext
PSTATE.IT[7:4] != '0000' \&\& PSTATE.IT[3:0] = '0000'
PSTATE.IT[2:0] != '000' when SCTLR/SCTLR_EL1.ITD == '1'
```

Exception returns or Debug state exits that set PSTATE.IT to a non-reserved value in T32 state can occur when the flow of execution returns to a point:

- Outside an IT block, but with the PSTATE.IT bits set to a value other than ‘00000000’.
- Inside an IT block, but with a different value of the PSTATE.IT bits than if the IT block had been executed without an exception return or Debug state exit.

In this case the instructions at the target of the exception return or Debug state exit can:

- Execute as if they passed the Condition code check for the remaining iterations of the PSTATE.IT state machine.
- Execute as NOPs. That is, they behave as if they failed the Condition code check for the remaining iterations of the PSTATE.IT state machine.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors

J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

- Execute as if they were unconditional, or as if the instruction were part of another IT block, in accordance with the behavior in Branching into an IT block on page J1-5364.

The remaining iterations of the PSTATE.IT state machine can behaves as follows:
- The PSTATE.IT state machine advances as if it were in an IT block.
- The PSTATE.IT bits are ignored.
- The PSTATE.IT bits are forced to ‘0000000’.

J1.1.8 Unallocated CP14 and CP15 instructions

In ARMv8-A, accesses to unallocated CP14 and CP15 register encodings are UNDEFINED.

J1.1.9 SBZ or SBO fields in instructions

Many of the A32 and T32 instructions have (0) or (1) in the instruction decode to indicate should-be-zero, SBZ, or should-be-one, SBO. Except for the specific cases called out in CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instructions in the base instruction set on page J1-5372, if the instruction bit pattern of an instruction is executed with these fields not having the should be values, one of the following can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as if the bit had the should-be value.
- Any destination registers of the instruction become UNKNOWN.

The exceptions to this rule are:
- LDM/LDMIA/LDMFD (T32) on page J1-5375.
- LDMDB/LDMEA on page J1-5377.
- LDR (literal) on page J1-5384.
- LDRB (literal) on page J1-5384.
- LDRH (literal) on page J1-5385.
- LDRSB (literal) on page J1-5385.
- LDRSH (literal) on page J1-5386.
- LDRD (immediate) on page J1-5386.
- LDRD (register) on page J1-5387.
- LDRD (literal) on page J1-5388.
- POP (T32) on page J1-5391.
- POP (A32) on page J1-5392.
- PUSH on page J1-5393.
- SDIV on page J1-5396.
- UDIV on page J1-5396.
- STM (STMIA, STMEA) on page J1-5399.
- STMDB (STMFD) on page J1-5401.

J1.1.10 Immediate constants in T32 data processing instructions

The immediate constants in the T32 data processing instructions describe immediate values generated by hw2[7:0] == 0000000 as being UNPREDICTABLE when

For the ARM architecture, these encodings produce the value 0b0000000.
J1.1.11   Unallocated values in register fields of CP14 and CP15 registers and translation table entries

Unless otherwise stated, all unallocated or reserved values of fields with allocated values within CP15 registers and translation table entries behave in one of the following ways:

- The encoding maps onto any of the allocated values, but otherwise does not cause CONSTRAINED UNPREDICTABLE behavior.
- The encoding causes effects that could be achieved by a combination of more than one of the allocated encodings.
- The encoding causes the field to have no functional effect.

J1.1.12   CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values

The ARM architecture allows copies of control values or data values to be cached in a cache or TLB. This can lead to CONSTRAINED UNPREDICTABLE behavior if the cache or TLB has not been correctly invalidated following a change of the control or data values.

Unless explicitly stated otherwise, the behavior of the PE is consistent with:

- The old data or control value.
- The new data or control value.
- An amalgamation of the old and new data or control values.

Note

This rule applies where inadequate invalidation of the TLB might cause multiple hits within the TLB. In this situation, a failure to invalidate the TLB by code running at a given Privilege level must not make access to regions of memory with permissions or attributes that could not be accessed at that Privilege level possible.

Alternatively, an implementation might generate a Data Abort exception when detecting multiple hits within a TLB, using the TLB Conflict fault code.

The choice between these behaviors might, in some implementations, vary for each use of a control or data value.

J1.1.13   CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization

The ARM architecture requires that changes to system registers must be synchronized before they take effect. This can lead to CONSTRAINED UNPREDICTABLE behavior if the synchronization has not been performed.

In these cases, the behavior of the processor is consistent with the unsynchronized control value being either the old value or the new value.

Where multiple control values are updated but not yet synchronized, each control value might independently be the old value or the new value.

In addition, where the unsynchronized control value applies to different areas of functionality, or what an implementation has constructed as different areas of functionality, those areas might independently treat the control value as being either the old value or the new value.

The choice between these behaviors might, in some implementations, vary for each use of a control value.

J1.1.14   Translation Table Base Address alignment

A misaligned Translation Table Base Address can occur if:

- The VMSAv8-32 Short-descriptor translation table format is enabled and TTBR0[13-N:7], which is defined to be RES0, contains one or more nonzero values.
- The VMSAv8-32 Long-descriptor translation table format is enabled, and TTBR0[x-1:3], TTBR1[x-1:3], HTTBR[x-1:3], or VTTBR[x-1:3], which are defined to be RES0, contain one or more nonzero values.
In the event of a misaligned Translation Table Base Address, one of the following behaviors can occur:

- The field that is defined to be RES0 is treated as if all bits were zero:
  - The value that is read back might be the value written or it might be zero.

- The calculation of an address for a translation table walk using that register can be corrupted in those bits that are nonzero.

### Handling of conceptual coprocessors CP10 and CP11

The floating-point instruction set covers both of the conceptual coprocessors CP10 and CP11. This means that CPACR, HCPTR, and NSACR all have control bits whose naming reflects the {CP10, CP11} coprocessors. If these control bits differ, then the behavior is the same as if the control bit for CP11 were equal to the control bit for CP10 in all respects, other than the value read back by a direct read of the CP11 control bit. After a register write that writes different values to the CP10 and CP11 control bits, a direct read of the register might return an UNKNOWN value for the CP11 control bit.

**Note**

This means that, when different values are written to the CP10 and CP11 control bits in a single register, the architecture permits but does not require that a read of that register returns the value written to the CP11 control bit.

### CONstrained UNPredICtable CPACR and NSACR settings

If CPACR.cp<n> contains the encoding ‘10’, then one of the following behaviors can occur:

- The encoding maps onto any of the allocated values, but otherwise does not cause UNPREDICTABLE behavior.

- The encoding causes effects that could be achieved by a combination of more than one of the allocated encodings.

**Note**

In ARMv7, CPACR had a D32DIS bit, and NSACR had an NSD32DIS bit. There is no CPACR.D32DIS or NSACR.NSD32DIS in ARMv8-A, and the corresponding bits in the two registers are RES0.

### Performance Monitors Extension

The following subsections describe constrained unpredictable behaviors in AArch32 use of the Performance Monitors Extension:

- **CONstrained UNPREDICTable accesses to PMXEVTYPER or PMXEVCNTR.**
- **CONstrained UNPREDICTable accesses to PMEVCNTR<n> and PMEVTYPER<n>** on page J1-5369.
- **CONstrained UNPREDICTable behavior caused by HDCR.HPMN** on page J1-5370.

### CONstrained UNPREDICTable accesses to PMXEVTYPER or PMXEVCNTR

The following cases can cause CONstrained UNPREDICTABLE behavior:

- If PMSELR.SEL is not equal to 31, and PMSELR.SEL is greater than or equal to PMCR.N, and the PE is executing in Secure state or in Non-secure Hyp mode.
- If PMSELR.SEL is not 31, and PMSELR.SEL is greater than or equal to HDCR.HPMN, and the PE is executing in a Non-secure mode other than Hyp mode.

In these UNPREDICTABLE cases, one of the following behaviors must occur:

- Accesses to PMXEVTYPER or PMXEVCNTR from that mode are UNDEFINED.
- Accesses to PMXEVTYPER or PMXEVCNTR from that mode behave as RAZ/WI.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors

J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

- Accesses to PMXEVTYPER or PMXEVCNTR from that mode execute as NOPs.
- Accesses to PMXEVTYPER or PMXEVCNTR from that mode behave as if PMSEL.R.SEL contains an UNKNOWN value that is less than the number of counters accessible at the current Exception level and Security state.
- Accesses to PMXEVTYPER or PMXEVCNTR behave as if PMSEL.R.SEL is 31.
- In Non-secure state, for an access to PMXEVTYPER or PMXEVCNTR from PL1 or a permitted access from PL0, if the counter is implemented but not accessible at the current Exception level, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

If PMSEL.R.SEL is equal to 31, then one of the following behaviors must occur:

- Accesses to PMXEVCNTR are UNDEFINED.
- Accesses to PMXEVCNTR behave as RAZ/WI.
- Accesses to PMXEVCNTR execute as NOPs.
- Accesses to PMXEVCNTR behave as if PMSEL.R.SEL contains an UNKNOWN value that is less than the number of counters accessible at the current Exception level and Security state.
- In Non-secure state, for an access to PMXEVCNTR from PL1 or a permitted access from PL0, if the counter is implemented but not accessible at the current Exception level, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

Note

In an implementation that includes EL2, in Non-secure state at PL0 and PL1, HDCR.HPMN, or MDCR_EL2.HPMN, identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

CONSTRANDED UNPREDICTABLE accesses to PMEVCNTR<n> and PMEVTYPER<n>

If <n> is greater than the number of counters available in the current Exception level and state, reads and writes of PMEVCNTR<n> and PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- In Non-secure state, for an access to PMEVCNTR<n> or PMEVTYPER<n> from PL1 or a permitted access from PL0, if the counter is implemented but not accessible at the current Exception level, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of PMUSERENR.EN is 1.
  - EL1 is using AArch64 and the value of PMUSERENR_EL0.EN is 1.

Note

In an implementation that includes EL2, in Non-secure state at PL0 and PL1, HDCR.HPMN, or MDCR_EL2.HPMN, identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors

J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

CONSTRANGED UNPREDICTABLE behavior caused by HDCR.HPMN

If HDCR.HPMN is greater than PMCR.N, then the behavior is as if HDCR.HPMN contains an UNKNOWN value less than or equal to the value of PMCR.N, in all respects other than the value read back from HDCR.HPMN.

If HDCR.HPMN is 0, then the behavior is either:

- As if HDCR.HPMN contains an UNKNOWN value less than or equal to PMCR.N, in all respects other than the value read back from HDCR.HPMN.
- As if it were not UNPREDICTABLE.

J1.1.17 Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED

When a CONSTRAINED UNPREDICTABLE instruction is treated as UNDEFINED, this generates an exception:

- If this exception is taken to an Exception level that is using AArch64 then ESR_ELx is UNKNOWN.
- If this exception is taken to EL2 and EL2 is using AArch32, then the HSR is UNKNOWN.

**Note**
The value written to ESR or HSR must be consistent with a value that could be created as the result of an exception from the same Exception level that generated the exception, but resulted from a situation that is not CONSTRAINED UNPREDICTABLE at that Exception level. This is to avoid a possible privilege violation.

J1.1.18 Out of range virtual address

If the PE executes an instruction for which the instruction address, size, and alignment mean it contains the bytes 0xFFFF FFFF and 0x0000 0000, then the bytes that wrap around and appear to be from 0x0000 0000 onwards come from an UNKNOWN address.

If the PE executes a load or store instruction for which the computed address, total access size, and alignment mean it accesses bytes 0xFFFF FFFF and 0x0000 0000, then the bytes that wrap around and appear to be from 0x0000 0000 onwards come from an UNKNOWN address.

J1.1.19 Instruction fetches from Device memory

Instruction fetches from Device memory are CONSTRAINED UNPREDICTABLE.

If a location in memory has the Device attribute and is not marked as execute-never, then an implementation might perform speculative instruction accesses to this memory location when the MMU is enabled.

If a branch causes the program counter to point to a location in memory with the Device attribute that is not marked as execute-never for the current Exception level for instruction fetches, then an implementation can perform one of the following behaviors:

- It can treat the instruction fetch as if it were to a memory location with the Normal, Non-cacheable attribute.
- It can take a Permission fault.

J1.1.20 Multi-access instructions that load the PC from Device memory

Multi-access instructions that load the PC from Device memory when the MMU is enabled are UNPREDICTABLE in AArch32 state. In the ARMv8-A architecture in AArch32, an implementation can perform one of the following behaviors:

- It can load the PC from the memory location as if the memory location had the Normal Non-cacheable attribute.
- It can take a permission fault.
J1.1.21 Programming CSSEL.R.Level for a cache level that is not implemented

If CSSEL.R.Level is programmed to a cache level that is not implemented, then a read of CSSEL.R returns an UNKNOWN value in CSSEL.R.Level.

If the CSSEL.R.Level is programmed to a cache level that is not implemented, then on a read of CCSIDR an implementation can perform one of the following behaviors:

- The CCSIDR read executes as a NOP.
- The CCSIDR read is UNDEFINED.
- The CCSIDR read returns an UNKNOWN value.

J1.1.22 Crossing a page boundary with different memory types or shareability attributes

A memory access from a load or store instruction that crosses a page boundary to a memory location that has a different type or shareability attribute results in CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation can perform one of the following behaviors:

- All memory accesses generated by the instruction use the memory type and shareability attributes associated with the first address accessed by the instruction.
- All memory accesses generated by the instruction use the memory type and shareability attributes associated with the last address accessed by the instruction.
- Each memory access generated by the instruction uses the memory type and shareability attribute associated with its own address.
- The instruction generates an alignment fault caused by the memory type, which, where two stages of translation are in use, is taken to EL1 if stage 1 has generated the mismatch, and to EL2 if stage 2 has generated the mismatch. If both stages generate the mismatch, the exception can be taken to either exception level.
- The instruction executes as a NOP.

J1.1.23 Crossing a 4KB boundary with a Device access

A memory access from a load or store instruction to Device memory that crosses a 4KB boundary results in CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation can perform one of the following behaviors:

- All memory accesses generated by the instruction are performed as if the presence of the boundary had no effect on the memory accesses.
- All memory accesses generated by the instruction are performed as if the presence of the boundary had no effect on the memory accesses, except that there is no guarantee of ordering between memory accesses.
- The instruction generates an Alignment fault.
- The instruction executes as a NOP.
J1.1.24   CONSTRAINED UNPREDICTABLE behavior for memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions

A number of memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions can result in CONSTRAINED UNPREDICTABLE behavior.

If an instructions listed in Memory hints, Advanced SIMD instructions, and miscellaneous instructions on page F4-2586 is CONSTRAINED UNPREDICTABLE but does not have an encoding of Op1= 101x001, Op2 = -, and Rn = 1111, then an implementation can treat these encodings in one of the following ways:

• The encoding is UNDEFINED.
• The instruction executes as a NOP.

When Op1= 101x001, Op2 = -, and Rn = 1111, PLD (literal) on page F7-2930 describes the behavior. This encoding is subject to the rules outlined in SBZ or SBO fields in instructions on page J1-5366.

J1.1.25   Out of range values of the Set/Way/Index fields in cache maintenance instructions

In the cache maintenance by set/way instructions DCCISW, DCCSW, and DCISW, if any set/way/index argument is larger than the value supported by the implementation, then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

• The instruction is UNDEFINED.
• The instruction performs cache maintenance on one of:
  — No cache lines.
  — A single arbitrary cache line.
  — Multiple arbitrary cache lines.

Note

This CONSTRAINED UNPREDICTABLE behavior applies, also, to the A64 cache maintenance by set/way instructions DC CISW, DC CSW, and DC ISW.

J1.1.26   CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instructions in the base instruction set

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A32 and T32 instructions listed in Alphabetical list of T32 and A32 base instruction set instructions on page F7-2634.

Note

• The pseudocode used in this section to describe cases that can result in CONSTRAINED UNPREDICTABLE behavior does not necessarily match the encoding specific pseudocode for a specific instruction.
• If an instruction can result in CONSTRAINED UNPREDICTABLE behavior that is not specific to that particular instruction, see the relevant section in this appendix for a description of the CONSTRAINED UNPREDICTABLE behavior.

BFC

For a description of these instructions and the encodings, see BFC on page F7-2684.

CONSTRAINED UNPREDICTABLE behavior

If msbit < lsbit, then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The output value in the registers is UNKNOWN.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors

J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

BFI

For a description of these instructions and the encodings, see BFI on page F7-2686.

CONSTRANGED UNPREDICTABLE behavior

If msbit < lsbit, then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The output value in the registers is UNKNOWN.

BKPT

For a description of this instruction and the encoding, see BKPT on page F7-2695.

CONSTRANGED UNPREDICTABLE behavior

For the A1 encoding:

• If cond != '1110' && cond != '1111', then one of the following behaviors occurs:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction executes unconditionally.
  — The instruction executes conditionally.

For the treatment of the case where cond == '1111' see CONSTRAINED UNPREDICTABLE behavior for memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions on page J1-5372.

CLZ

For a description of this instruction and the encoding, see CLZ on page F7-2708.

CONSTRANGED UNPREDICTABLE behavior

For the T1 encoding:

• If !consistent(Rm), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The register specified by hw1[3:0] is used as the source register.
  — The register specified by hw2[3:0] is used a the source register.
  — The value in the destination register is UNKNOWN.

CMP (register)

For a description of this instruction and the encoding, see CMP (register) on page F7-2716.

CONSTRANGED UNPREDICTABLE behavior

For the T2 encoding:

• If n < 8 && m < 8, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the comparison between Rn and Rm.
  — The condition flags become UNKNOWN.
CRC32, CRC32C

For a description of this instruction and the encoding, see CRC32 on page F7-2723 and CRC32C on page F7-2725.

CONSTRAINED UNPREDICTABLE behavior

If size == 64, then one of the following behaviors can occur:
   • The instruction is UNDEFINED.
   • The instruction executes as a NOP.
   • The instruction behaves as if sz == '10'.

For the A1 encoding:
   • If cond != '1110', then one of the following behaviors can occur:
     • The instruction is UNDEFINED.
     • The instruction executes as a NOP.
     • The instruction is executed unconditionally.
     • The instruction is executed conditionally.

HLT

For a description of this instruction and the encoding, see HLT on page F7-2745.

CONSTRAINED UNPREDICTABLE behavior

For the A1 encoding:
   • If cond != '1110' && cond != '1111', then one of the following behaviors occurs:
     — The instruction is UNDEFINED.
     — The instruction executes as a NOP.
     — The instruction is executed unconditionally.
     — The instruction is executed conditionally.

For the treatment of the case where cond == '1111' see CONSTRAINED UNPREDICTABLE behavior for memory hints, Advanced SIMD instructions, and miscellaneous A32 instructions on page J1-5372.

IT

For a description of this instruction and the encoding, see IT on page F7-2750.

CONSTRAINED UNPREDICTABLE behavior

For the T1 encoding:
   • If firstcond == '1111'||(firstcond == '1110' & BitCount(mask)!= 1) then one of the following behaviors occurs:
     — The instruction is undefined.
     — The instruction executes as a NOP.
     — firstcond == '1111' is treated the same as firstcond == '1110', meaning the always condition, and the PSTATE.IT state machine is progressed in the same way as for any other cond_base value.

LDC/LDC2 (literal)

For a description of this instruction and the encoding, see LDC, LDC2 (literal) on page F7-2768.

CONSTRAINED UNPREDICTABLE behavior

If W == '1' || P == '0' & CurrentInstrSet() != InstrSet_ARM, then one of the following behaviors can occur:
   • The instruction is UNDEFINED.
   • The instruction executes as a NOP.
• The load instruction operates without writeback.

      —— Note ————
      This is consistent with ignoring writes to the PC.

• The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, see Using R15 on page J1-5363.

**LDM/LDMIA/LDMFD (T32)**

For a description of this instruction and the encoding, see LDM, LDMIA, LDMFD on page F7-2771.

**CONSTRAINED UNPREDICTABLE behavior**

For the T1 encoding:

• If `BitCount(registers) < 1`, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

For the T2 encoding:

• If `BitCount(registers) < 2`, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction loads a single register using the specified addressing modes.
  — The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

• If `hw2[13]` is set to 1, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

      —— Note ————
      This is an exception to the requirements described in SBZ or SBO fields in instructions on page J1-5366.

• If `P == ‘1’ && M == ‘1’`, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

• If `wback && registers<n> == ‘1’`, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the loads using the specified addressing mode, and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.
LDM/LDMIA/LDMFD (A32)

For a description of this instruction and the encoding, see *LDM, LDMIA, LDMFD* on page F7-2771.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If $\text{BitCount(registers)} < 1$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

- If $\text{wback} && \text{registers}<n> == '1'$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

LDMDA/LDMFA

For a description of this instruction and the encoding, see *LDMDA, LDMFA* on page F7-2778.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If $\text{BitCount(registers)} < 1$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an LDM with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15.

- If $\text{wback} && \text{registers}<n> == '1'$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

LDMIB/LDMED

For a description of this instruction and the encoding, see *LDMIB, LDMED* on page F7-2782.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If $\text{BitCount(registers)} < 1$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an LDM with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15.
• If \( \text{wback} \&\& \text{registers}<n> == '1' \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

**LDMDB/LDMEA**

For a description of this instruction and the encoding, see *LDMDB, LDMEA* on page F7-2780.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:
• If \( \text{wback} \&\& \text{registers}<n> == '1' \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

For the A1 encoding:
• If \( \text{BitCount(registers)} < 1 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as an LDM with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

For the T1 encoding:
• If \( \text{BitCount(registers)} < 2 \), one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction loads a single register using the specified addressing modes.
  — The instruction operates as an LDM with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15.

• If \( \text{hw2}[13] \) is set to 1, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

**Note**

This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page J1-5366.

• If \( P == '1' \&\& M == '1' \), then one of the following behaviors can occur:
  — The instruction is undefined.
  — The instruction executes as a NOP.
  — The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.
LDR (immediate, T32)
For a description of this instruction and the encoding, see LDR (immediate) on page F7-2784.

**CONSTRAINED UNPREDICTABLE behavior**
For the T4 encoding:

- If \( \text{wback} \land n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDR (immediate, A32)
For a description of this instruction and the encoding, see LDR (immediate) on page F7-2784.

**CONSTRAINED UNPREDICTABLE behavior**
For the A1 encoding:

- If \( \text{wback} \land n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDR (register, A32)
For a description of this instruction and the encoding, see LDR (register) on page F7-2790.

**CONSTRAINED UNPREDICTABLE behavior**
For the A1 encoding:

- If \( \text{wback} \land n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRB (immediate, T32)
For a description of this instruction and the encoding, see LDRB (immediate) on page F7-2793.

**CONSTRAINED UNPREDICTABLE behavior**
For the T3 encoding:

- If \( \text{wback} \land n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
— The instruction performs all the loads using the specified addressing mode and the content of the
register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction,
the base register might be corrupted so that the instruction cannot be repeated.

**LDRB (immediate, A32)**

For a description of this instruction and the encoding, see *LDRB (immediate)* on page F7-2793.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the
    register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction,
    the base register might be corrupted so that the instruction cannot be repeated.

**LDRB (register)**

For a description of this instruction and the encoding, see *LDRB (register)* on page F7-2798.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the
    register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction,
    the base register might be corrupted so that the instruction cannot be repeated.

**LDRBT**

For a description of this instruction and the encoding, see *LDRBT* on page F7-2801.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 and A2 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the
    register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction,
    the base register might be corrupted so that the instruction cannot be repeated.

**—— Note ———**

Pre-indexed and post-indexed addressing implies writeback.

- When the Rn field specifies R15, then this instruction can be treated either as described in this section or as
described in *LDRB (literal)* on page J1-5384.
LDRH (immediate, T32)

For a description of this instruction and the encoding, see LDRH (immediate) on page F7-2818.

**CONSTRAINED UNPREDICTABLE behavior**

For the T3 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRH (immediate, A32)

For a description of this instruction and the encoding, see LDRH (immediate) on page F7-2818.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRH (register)

For a description of this instruction and the encoding, see LDRH (register) on page F7-2823.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.
LDRHT

For a description of this instruction and the encoding, see *LDRHT on page F7-2825.*

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

--- Note
Pre-indexed and post-indexed addressing implies writeback.

- When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in *LDRH (literal) on page J1-5385.*

**LDRSB (immediate)**

For a description of this instruction and the encoding, see *LDRSB (immediate) on page F7-2827.*

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 and T2 encoding:

- If `wback && n == t`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

**LDRSB (register)**

For a description of this instruction and the encoding, see *LDRSB (register) on page F7-2832.*

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If `wback && (n == t)`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.
LDRSBT

For a description of this instruction and the encoding, see LDRSBT on page F7-2834.

CONstrained unpredictable behavior

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note

Pre-indexed and post-indexed addressing implies writeback.

• When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in LDRSB (literal) on page J1-5385.

LDRSH (immediate)

For a description of this instruction and the encoding, see LDRSH (immediate) on page F7-2836.

CONstrained unpredictable behavior

For the T2 and A1 encoding:

- If `wback && n == t`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRSH (register)

For a description of this instruction and the encoding, see LDRSH (register) on page F7-2841.

CONstrained unpredictable behavior

For the A1 encoding:

- If `wback && n == t`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.
LDRSHT

For a description of this instruction and the encoding, see *LDRSHT* on page F7-2844.

For the A1 and A2 encoding:

- If \( \text{wback} \& \& n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed and post-indexed addressing implies writeback.

• When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in *LDRSB (literal)* on page J1-5385.

LDRT

For a description of this instruction and the encoding, see *LDRT* on page F7-2846.

For the A1 and A2 encoding:

- If \( \text{wback} \& \& n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

**Note**

Pre-indexed and post-indexed addressing implies writeback.

• When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in *LDRSB (literal)* on page J1-5385.
LDR (literal)
For a description of this instruction and the encoding, see *LDR (literal)* on page F7-2788.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is undefined.
  - The instruction is treated as a NOP.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page J1-5363 apply.

  **Note**
  This is an exception to the principle in *SBZ or SBO fields in instructions* on page J1-5366.

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in *SBZ or SBO fields in instructions* on page J1-5366 or the requirements described in *LDR (immediate, T32)* on page J1-5378.

LDRB (literal)
For a description of this instruction and the encoding, see *LDRB (literal)* on page F7-2796.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is undefined.
  - The instruction is treated as a NOP.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page J1-5363 apply.

  **Note**
  This is an exception to the principle in *SBZ or SBO fields in instructions* on page J1-5366.

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in *SBZ or SBO fields in instructions* on page J1-5366 or the requirements described in *LDRB (immediate, T32)* on page J1-5378.
**LDRH (literal)**

For a description of this instruction and the encoding, see *LDRH (literal)* on page F7-2821.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is UNDEFINED.
  - The instruction is treated as a NOP.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page J1-5363 apply.

  __________ Note __________

  This is an exception to the principle in *SBZ or SBO fields in instructions* on page J1-5366.

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in *SBZ or SBO fields in instructions* on page J1-5366 or the requirements described in *LDRH (immediate, T32)* on page J1-5380.

**LDRSB (literal)**

For a description of this instruction and the encoding, see *LDRSB (literal)* on page F7-2830.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is UNDEFINED.
  - The instruction is treated as a NOP.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page J1-5363 apply.

  __________ Note __________

  This is an exception to the principle in *SBZ or SBO fields in instructions* on page J1-5366.

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in *SBZ or SBO fields in instructions* on page J1-5366 or the requirements described in *LDRSB (immediate)* on page J1-5381.
LDRSH (literal)

For a description of this instruction and the encoding, see LDRSH (literal) on page F7-2839.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If bit[24] has the same value as bit[21]:
  - The instruction is UNDEFINED.
  - The instruction is treated as a NOP.
  - The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  - The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing mode as described in the immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page J1-5363 apply.

  **Note**

  This is an exception to the principle in SBZ or SBO fields in instructions on page J1-5366.

- If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described in SBZ or SBO fields in instructions on page J1-5366 or the requirements described in LDRSH (immediate) on page J1-5382.

LDRD (immediate)

For a description of this instruction and the encoding, see LDRD (immediate) on page F7-2803.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( \text{wback} \land (n == t \lor n == t2) \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

For the T1 encoding:

- If \( t == t2 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

For the A1 encoding:

- If \( \text{P} == '0' \land \text{W} == '1' \) then one of the following behaviors can occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction behaves as if the values of P and W were as follows:
    \[
    \begin{align*}
    \text{P} & == '1' \land \text{W} == '0' \\
    \text{P} & == '1' \land \text{W} == '1' \\
    \text{P} & == '0' \land \text{W} == '0'
    \end{align*}
    \]
• If $Rt_{<0>} == '1'$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The behavior is the same as if $Rt_{<0>} == '0'$.
  — The register accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and both have $bit[0] == 1$.
  — The registers accessed are specified by Rt and Rt+1.

  **Note**

  This does not apply if $Rt == '1111'$.

**LDRD (register)**

For a description of this instruction and the encoding, see *LDRD (register)* on page F7-2808.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

• If $wback \&\& (n == t || n == t2)$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

• If $P == '0' \&\& W == '1'$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction behaves as if the values of $P$ and $W$ were as follows:
    
    $P == '1' \&\& W == '0'$
    $P == '1' \&\& W == '1'$
    $P == '0' \&\& W == '0'$

• If $m == t || m == t2$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction loads register $Rm$ with an UNKNOWN value.

• If $Rt_{<0>} == '1'$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The behavior is the same as if $Rt_{<0>} == '0'$.
  — The registers accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and in both cases $bit[0] == 1$.
  — The registers accessed are specified by Rt and Rt+1.

  **Note**

  This does not apply if $Rt == '1111'$.
**LDRD (literal)**

For a description of this instruction and the encoding, see *LDRD (literal)* on page F7-2806.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If bit[24] and bit[21] do not have their *should be* values, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction is treated as if the bits had their *should be* values.

- If \(Rt<0>='1'\), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if \(Rt<0>='0'\).
  - The registers accessed are both specified by \(Rt\). This means that \(Rt\) and \(Rt+1\) are the same, and both have bit[0] equal to 1.
  - The registers accessed are specified by \(Rt\) and \(Rt+1\).

  **Note**

  This does not apply if \(Rt='1111'\).

For the T1 encoding:

- If \(t==t2\), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

- If \(W=='1'\), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction is treated as if \(W=='0'\).
  - The instruction uses the P and W bits as described for *LDRD (immediate)* on page J1-5386.

**LDREX**

For a description of this instruction and the encoding, see *LDREX* on page F7-2810.

**CONSTRAINED UNPREDICTABLE behavior**

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

**LDREXH**

For a description of this instruction and the encoding, see *LDREXH* on page F7-2816.

**CONSTRAINED UNPREDICTABLE behavior**

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
LDREXB
For a description of this instruction and the encoding, see LDREXB on page F7-2812.

**CONSTRAINED UNPREDICTABLE behavior**
If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

LDAEX
For a description of this instruction and the encoding, see LDAEX on page F7-2754.

**CONSTRAINED UNPREDICTABLE behavior**
If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

LDAEXH
For a description of this instruction and the encoding, see LDAEXH on page F7-2760.

**CONSTRAINED UNPREDICTABLE behavior**
If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

LDAEXB
For a description of this instruction and the encoding, see LDAEXB on page F7-2756.

**CONSTRAINED UNPREDICTABLE behavior**
If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

LDREXD
For a description of this instruction and the encoding, see LDREXD on page F7-2814.

**CONSTRAINED UNPREDICTABLE behavior**
For all encodings:

- If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

For the T1 encoding:

- If t == t2, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.
For the A1 encoding:

- If $Rt<0>=='1'$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if the $Rt<0>=='0'$.
  - The registers accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and both have bit[0] == 1.
  - The registers accessed are specified by Rt and Rt+1.

--- Note ---

If $t2 == 15$, then the requirements described in Using R15 on page J1-5363 apply.

---

**LDAEXD**

For a description of this instruction and the encoding, see LDAEXD on page F7-2758.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

For the T1 encoding:

- If $t == t2$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

For the A1 encoding:

- If $Rt<0>=='1'$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if the $Rt<0>=='0'$.
  - The registers accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and both have bit[0] == 1.
  - The registers accessed are specified by Rt and Rt+1.

--- Note ---

If $t2 == 15$, then the requirements described in Using R15 on page J1-5363 apply.
MOV (register, T32)
For a description of this instruction and the encoding, see MOV, MOVS (register) on page F7-2876.

CONSTRAINED UNPREDICTABLE behavior
For the T2 encoding:

- If InIITBlock(), then one of the following behaviors can occur:
  - The instruction generates an UNDEFINED exception.
  - The instruction is executed as if it passed its condition code check.
  - The instruction executes as a NOP. That is, it behaves as if it failed its condition code check.
  - The instruction is treated as MOV Rd, Rm.

Note
This is an exception to the general behavior described in CONSTRAINED UNPREDICTABLE instructions in an IT
block on page J1-5365.

MRRC, MRRC2
For a description of this instruction and the encoding, see MRRC, MRRC2 on page F7-2890.

CONSTRAINED UNPREDICTABLE behavior
For all encodings:

- If t == t2, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The register that is transferred takes an UNKNOWN value.

MSR (register)
For a description of this instruction and the encoding, see MSR (register) on page F7-2902.

CONSTRAINED UNPREDICTABLE behavior
For all encodings:

- If mask == '00', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

POP (T32)
For a description of this instruction and the encoding, see POP on page F7-2939.

CONSTRAINED UNPREDICTABLE behavior
For the T1 encoding:

- If BitCount(registers) < 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a POP with the same addressing mode but targeting an unspecified set of
    registers. These registers might include R15. If the instruction specifies writeback, the modification to
    the base address on writeback might differ from the number of registers loaded.
For the T2 encoding:

- If `BitCount(registers) < 2`, one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction loads a single register using the specified addressing modes.
  - The instruction operates as an `LDM` with the same addressing mode but targeting an unspecified set of registers. These might include R15.

- If `hw2 bit[13]` is set to 1, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode but R13 is **UNKNOWN**.

--- **Note**

This is an exception to the requirements described in *SBZ or SBO fields in instructions on page J1-5366*.  

- If `P == '1' && M == '1'`, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

For the T3 encoding:

- If `t == 13`, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction performs the load using the specified addressing mode but R15 is **UNKNOWN**.

--- **Note**

This is an exception to the requirements described in *Using R13 on page J1-5363*.  

**POP (A32)**

For a description of this instruction and the encoding, see *POP on page F7-2939*.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If `bit[13]` is set to 1, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode but R13 is **UNKNOWN**.
For the A2 encoding:

- If \( t = 13 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the load using the specified addressing mode but R13 is UNKNOWN.

**Note**

This is an exception to the requirements described in *Using R13 on page J1-5363*.

**PUSH**

For a description of this instruction and the encoding, see *PUSH on page F7-2945*.

**CONSTRAINED UNPREDICTABLE behavior**

For the T1 encoding:

- If \( \text{BitCount}(\text{registers}) < 1 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a *PUSH* with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

For the T2 encoding:

- If \( \text{BitCount}(\text{registers}) < 2 \), one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction stores a single register using the specified addressing modes.
  - The instruction operates as a *PUSH* with the same addressing mode but targeting an unspecified set of registers. These might include R15.

- If hw2 bit[13] is set, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode but R13 is UNKNOWN.

**Note**

This is an exception to the requirements described in *SBZ or SBO fields in instructions on page J1-5366*.

- If hw2 bit[15] is set to 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode, but R15 is UNKNOWN.

**Note**

This is an exception to the requirements described in *SBZ or SBO fields in instructions on page J1-5366*. 
RBIT

For a description of this instruction and the encoding, see *RBIT* on page F7-2968.

**CONSTRAINED UNPREDICTABLE behavior**

For the T1 encoding:

• If \( \text{Consistent}(Rm) \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The register specified by \( Rm \) in halfword 1 is used as the source register.
  — The register specified by \( Rm \) in halfword 2 is used as the source register.
  — The value in the destination register is UNKNOWN.

REV

For a description of this instruction and the encoding, see *REV* on page F7-2970.

**CONSTRAINED UNPREDICTABLE behavior**

For the T2 encoding:

• If \( \text{Consistent}(Rm) \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The register specified by \( Rm \) in halfword 1 is used as the source register.
  — The register specified by \( Rm \) in halfword 2 is used as the source register.
  — The value in the destination register is UNKNOWN.

REV16

For a description of this instruction and the encoding, see *REV16* on page F7-2972.

**CONSTRAINED UNPREDICTABLE behavior**

For the T2 encoding:

• If \( \text{Consistent}(Rm) \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The register specified by \( Rm \) in halfword 1 is used as the source register.
  — The register specified by \( Rm \) in halfword 2 is used as the source register.
  — The value in the destination register is UNKNOWN.
REVSH
For a description of this instruction and the encoding, see REVSH on page F7-2974.

**CONSTRAINED UNPREDICTABLE behavior**
For the T2 encoding:

- If ! Consistent(Rm), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The register specified by Rm in halfword 1 is used as the source register.
  - The register specified by Rm in halfword 2 is used as the source register.
  - The value in the destination register is UNKNOWN.

SBFX
For a description of this instruction and the encoding, see SBFX on page F7-3017.

**CONSTRAINED UNPREDICTABLE behavior**
For all encodings:

- If msbit > 31, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The output value in the register is UNKNOWN.

UBFX
For a description of this instruction and the encoding, see UBFX on page F7-3198.

**CONSTRAINED UNPREDICTABLE behavior**
For all encodings:

- If msbit > 31, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The output value in the register is UNKNOWN.
SDIV

For a description of this instruction and the encoding, see SDIV on page F7-3019.

CONSTRAINED UNPREDICTABLE behavior

For the T1 encoding:

- If hw2 bits[15:12] \(!= '1111'\), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

  ——— Note ———
  This is an exception to the requirements described in SBZ or SBO fields in instructions on page J1-5366.

For the A1 encoding:

- If bits[15:12] \(!= '1111'\), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

  ——— Note ———
  This is an exception to the requirements described in SBZ or SBO fields in instructions on page J1-5366.

UDIV

For a description of this instruction and the encoding, see UDIV on page F7-3202.

CONSTRAINED UNPREDICTABLE behavior

For the T1 encoding:

- If hw2 bits[15:12] \(!= '1111'\), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

  ——— Note ———
  This is an exception to the requirements described in SBZ or SBO fields in instructions on page J1-5366.
For the A1 encoding:

- If bits[15:12] != '1111', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

Note
This is an exception to the requirements described in SBZ or SBO fields in instructions on page J1-5366.

SMULL
For a description of this instruction and the encoding, see SMULL, SMULLS on page F7-3068.

CONSTRAINED UNPREDICTABLE behavior
For all encodings:
- If dHi == dLo, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

SMLAL
For a description of this instruction and the encoding, see SMLAL, SMLALS on page F7-3046.

CONSTRAINED UNPREDICTABLE behavior
For all encodings:
- If dHi == dLo, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

SMLALBB, SMLALBT, SMLALTB, SMLALTT
For a description of this instruction and the encoding, see SMLALBB, SMLALBT, SMLALTB, SMLALTT on page F7-3048.

CONSTRAINED UNPREDICTABLE behavior
For all encodings:
- If dHi == dLo, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.
SMLALD

For a description of this instruction and the encoding, see SMLAD, SMLADX on page F7-3044.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d_{Hi} = d_{Lo} \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

SMLSLD

For a description of this instruction and the encoding, see SMLSD, SMLSDX on page F7-3054.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d_{Hi} = d_{Lo} \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

UMULL

For a description of this instruction and the encoding, see UMULL, UMULLS on page F7-3220.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d_{Hi} = d_{Lo} \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

UMAAL

For a description of this instruction and the encoding, see UMAAL on page F7-3216.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d_{Hi} = d_{Lo} \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.
UMLAL

For a description of this instruction and the encoding, see UMLAL, UMLALS on page F7-3218.

CONSTRU NED UNPREDICTABLE behavior

For all encodings:

- If dHi == dLo, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register takes an UNKNOWN value.

STC, STC2

For a description of this instruction and the encoding, see STC, STC2 on page F7-3087.

CONSTRU NED UNPREDICTABLE behavior

For all encodings:

- If n == 15 && (wback || CurrentInstrSet() != InstrSet_A32), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

Note
This is consistent with ignoring writes to the PC.

- The instruction set uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page J1-5363 apply.

Note
Use of R15 by the T32 STC instruction is also covered by Using R15 on page J1-5363.

STM (STMIA, STMEA)

For a description of this instruction and the encoding, see STM, STMIA, STMEA on page F7-3102.

CONSTRU NED UNPREDICTABLE behavior

For all encodings:

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.

For the T1 and A1 encoding:

- If BitCount(registers) < 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.
For the T2 encoding:

- If \( \text{BitCount}(\text{registers}) < 2 \), then one of the following behaviors occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction stores a single register using the specified addressing modes.
  - The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These might include R15.

- If hw2 bit[13] is set, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the stores using the specified addressing mode but the value of R13 is UNKNOWN.

  **Note**
  This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page J1-5366.

- If hw2 bit[15] is set to 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

  **Note**
  This is an exception to the requirements described in *SBZ or SBO fields in instructions* on page J1-5366.

- If \( \text{wback} \&\& \text{registers}<n> == '1' \), and that case is defined to be UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode and the value stored for the base register is UNKNOWN.

**STMDA (STMED)**

For a description of this instruction and the encoding, see *STMDA, STMED* on page F7-3106.

**CONstrained UNPREDICTABLE behavior**

For the A1 encoding:

- If \( \text{BitCount}(\text{registers}) < 1 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.
• If the instruction uses R15 as a base register and specifies writeback, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction is performed without writeback.

  ____________
  ____________
  _Note_
  This is consistent with ignoring writes to the PC.

  — The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page J1-5363 apply.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.

STMIB (STMFA)
For a description of this instruction and the encoding, see STMIB, STMFA on page F7-3110.

CONSTRAINED UNPREDICTABLE behavior
For the A1 encoding:
• If BitCount(registers) < 1, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

• If the instruction uses R15 as a base register and specifies writeback, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction is performed without writeback.

  ____________
  ____________
  _Note_
  This is consistent with ignoring writes to the PC.

  — The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page J1-5363 apply.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.

STMDB (STMFD)
For a description of this instruction and the encoding, see STMDB, STMFD on page F7-3108.

CONSTRAINED UNPREDICTABLE behavior
For all encodings:
• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.
For the A1 encoding:

- If BitCount(registers) < 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

For the T1 encoding:

- If BitCount(register) < 2, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction stores a single register using the specified addressing mode.
  - The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These might include R15.

- If wback && registers<n> == '1', and that case is defined to be UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode and the value stored for the base register is UNKNOWN.

- If hw2 bit[13] is set to 1, then one of the following behaviors occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

  --- Note ---

  This is an exception to the requirements described in SBZ or SBO fields in instructions on page J1-5366.

- If hw2 bit[15] is set to 1, then one of the following behaviors occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

  --- Note ---

  This is an exception to the requirement described in SBZ or SBO fields in instructions on page J1-5366.
STR (immediate, T32)

For a description of this instruction and the encoding, see STR (register) on page F7-3116.

CONSTRANDED UNPREDICTABLE behavior

For the T3 encoding:

- If \( t = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.

For the T4 encoding:

- If \( \text{wback} \&\& \ n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If \( \text{wback} \&\& \ n = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  Note

  This is consistent with ignoring writes to the PC.

  The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page J1-5363 apply.

  Note

  Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.

STR (immediate, A32)

For a description of this instruction and the encoding, see STR (immediate) on page F7-3112.

CONSTRANDED UNPREDICTABLE behavior

For the A1 encoding:

- If \( t = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
• If \( \text{wback} \land n = t \), then one of the following behaviors can occur:
  — The instruction is \textbf{UNDEFINED}.
  — The instruction executes as a \textbf{NOP}.
  — The instruction performs the store using the specified addressing mode but the value stored is \textbf{UNKNOWN}.

• If \( \text{wback} \land n = 15 \), then one of the following behaviors can occur:
  — The instruction is \textbf{UNDEFINED}.
  — The instruction executes as a \textbf{NOP}.
  — The store instruction operates without writeback.

\textbf{Note}
This is consistent with ignoring writes to the PC.

— The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in \textit{Using R15 on page J1-5363} apply.

\textbf{Note}
Pre-indexed and post-indexed addressing implies writeback.

• The value used by stores using R15 as a base register follow the requirements described in \textit{Using R15 on page J1-5363}.

\textbf{STR (register)}

For a description of this instruction and the encoding, see \textit{STR (register) on page F7-3116}.

\textbf{CONSTRAINED UNPREDICTABLE behavior}

For the T2 encoding:

• If \( t = 15 \), then one of the following behaviors can occur:
  — The instruction is \textbf{UNDEFINED}.
  — The instruction executes as a \textbf{NOP}.
  — The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is \textbf{UNKNOWN}.

• The value used by stores using R15 as a base register follow the requirements described in \textit{Using R15 on page J1-5363}.

For the A1 encoding:

• If \( \text{wback} \land n = t \), then one of the following behaviors can occur:
  — The instruction is \textbf{UNDEFINED}.
  — The instruction executes as a \textbf{NOP}.
  — The instruction performs the store using the specified addressing mode but the value stored is \textbf{UNKNOWN}. 

• If \( \text{wback} \land n = 15 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates without writeback.

  ______ Note _________
  This is consistent with ignoring writes to the PC.

  ______ Note _________
  The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page J1-5363 apply.

  ______ Note _________
  Pre-indexed and post-indexed addressing implies writeback.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.

**STRB (immediate), T32**

For a description of this instruction and the encoding, see *STRB (immediate)* on page F7-3119.

**CONSTRAINED UNPREDICTABLE behavior**

For the T3 encoding:

• If \( t = 15 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

• If \( \text{wback} \land n = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

• If \( \text{wback} \land n = 15 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates without writeback.

  ______ Note _________
  This is consistent with ignoring writes to the PC.

  ______ Note _________
  The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page J1-5363 apply.

  ______ Note _________
  Pre-indexed and post-indexed addressing implies writeback.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.
STRB (Immediate, A32)

For a description of this instruction and the encoding, see STRB (Immediate) on page F7-3119.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If \( t = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- If \( wback \land n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If \( wback \land n = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

STRB (Register)

For a description of this instruction and the encoding, see STRB (Register) on page F7-3122.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 and T2 encoding:

- If \( t = 15 \) is UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
For the A1 encoding:

- If \( \text{wback} && n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If \( \text{wback} && n = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  **Note**
  This is consistent with ignoring writes to the PC.

  — The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15 on page J1-5363* apply.

  **Note**
  Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15 on page J1-5363*.

**STRBT**

For a description of this instruction and the encoding, see *STRBT on page F7-3125*.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( t = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15 on page J1-5363*.

For the A1 and A2 encoding:

- If \( \text{wback} && n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors
J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

• If \( wback \&\& n = 15 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates without writeback.

  — **Note**
    
    This is consistent with ignoring writes to the PC.

  — The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15 on page J1-5363* apply.

  — **Note**
    
    Pre-indexed and post-indexed addressing implies writeback.

**STRH (immediate, T32)**

For a description of this instruction and the encoding, see *STRH (immediate)* on page F7-3140.

**CONSTRAINED UNPREDICTABLE behavior**

For T2 and T3 encodings:

• If \( t = 15 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

• The value used by stores using R15 as a base register follow the requirements described in *Using R15 on page J1-5363*.

For the T3 encoding:

• If \( wback \&\& n = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

• If \( wback \&\& n = 15 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates without writeback.

  — **Note**
    
    This is consistent with ignoring writes to the PC.

  — The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15 on page J1-5363* apply.

  — **Note**
    
    Pre-indexed and post-indexed addressing implies writeback.
STRH (immediate, A32)
For a description of this instruction and the encoding, see STRH (immediate) on page F7-3140.

**CONSTRANGED UNPREDICTABLE behavior**
For the A1 encoding:

- If \( t = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- If \( \text{wback} \) \& \( n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If \( \text{wback} \) \& \( n = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  **Note**
  This is consistent with ignoring writes to the PC.

  This instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page J1-5363 apply.

**Note**
Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.

STRH (register)
For a description of this instruction and the encoding, see STRH (register) on page F7-3143.

**CONSTRANGED UNPREDICTABLE behavior**
For the T2 and A1 encoding:

- If \( t = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.
For the A1 encoding:

- If wback && n == $t$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If wback && n == 15, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  ______ Note ________

  This is consistent with ignoring writes to the PC.

  ______ Note ________

  The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page J1-5363 apply.

  ______ Note ________

  Pre-indexed and post-indexed addressing implies writeback.

STRHT

For a description of this instruction and the encoding, see STRHT on page F7-3145.

CONstrained UNPREDICTABLE behavior

For all encodings:

- If $t == 15$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page J1-5363.

For the A1 and A2 encoding:

- If wback && n == $t$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
• If \( wback \&\& n = 15 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates without writeback.

  **Note**
  This is consistent with ignoring writes to the PC.

  — The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15 on page J1-5363* apply.

  **Note**
  Pre-indexed and post-indexed addressing implies writeback.

**STRT**

For a description of this instruction and the encoding, see *STRT on page F7-3147*.

**CONSTRAINED UNPREDICTABLE behavior**

For the T1 encoding:

• If \( t = 15 \) is UNPREDICTABLE, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

For the A1 and A2 encoding:

• If \( wback \&\& n = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

• If \( wback \&\& n = 15 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates without writeback.

  **Note**
  This is consistent with ignoring writes to the PC.

  — The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15 on page J1-5363* apply.

  **Note**
  Pre-indexed and post-indexed addressing implies writeback.

• The value used by stores using R15 as a base register follow the requirements described in *Using R15 on page J1-5363*. 
STRD (immediate)

For a description of this instruction and the encoding, see \textit{STRD (immediate) on page F7-3127}.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If $t = 15$ or $t_2 = 15$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- If $\text{wback} \land (n = t \lor n = t_2)$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store of the registers specified using the specified addressing mode but the value of the registers stored is UNKNOWN.

- If $\text{wback} \land n = 15$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  \begin{itemize}
  \item \textbf{Note}
  \end{itemize}

  This is consistent with ignoring writes to the PC.

  \begin{itemize}
  \item The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in \textit{Using R15 on page J1-5363} apply.
  \end{itemize}

  \begin{itemize}
  \item \textbf{Note}
  \end{itemize}

  Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using R15 as a base register follow the requirements described in \textit{Using R15 on page J1-5363}.

For the A1 encoding:

- If $\text{Rt}<0> == '1'$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if $\text{Rt}<0> == '0'$.
  - The registers accessed are both specified by Rt. For example, Rt and Rt+1 are the same, and both have bit[0] equal to 1.
  - The registers accessed are specified by Rt and Rt+1.

  \begin{itemize}
  \item \textbf{Note}
  \end{itemize}

  This does not apply if $Rt=='1111'$.

- If $P == '0' \land W == '1'$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction is treated as a NOP.
  - The instruction behaves as if the values of P and W were one of:

    \begin{itemize}
    \item $P == '1' \land W == '0'$
    \end{itemize}
P == ‘1’ && W == ‘1’
P == ‘0’ && W == ‘0’

**STRD (register)**

For a description of this instruction and the encoding, see *STRD (register)* on page F7-3130.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If \( t2 = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to \( R15 \) is UNKNOWN.

- If \( \text{wback} && (n == t || n == t2) \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store of the registers specified using the specified addressing mode but the value of the registers stored is UNKNOWN.

- If \( \text{wback} && n == 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  — **Note**
  
  This is consistent with ignoring writes to the PC.

  — The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15* on page J1-5363 apply.

  — **Note**
  
  Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using \( R15 \) as a base register follow the requirements described in *Using R15* on page J1-5363.

- If \( \text{rt<16>= '1'} \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if \( \text{rt<16>= '0'} \).
  - The registers accessed are both specified by \( \text{Rt} \). For example, \( \text{Rt} \) and \( \text{Rt}+1 \) are the same, and both have bit[0] equal to 1.
  - The registers accessed are specified by \( \text{Rt} \) and \( \text{Rt}+1 \).

  — **Note**
  
  This does not apply if \( \text{rt}=='1111' \).

- If \( \text{P} == '0' && \text{W} == '1' \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction is treated as a NOP.
— The instruction behaves as if the values of P and W were one of:
   P == ‘1’ && W == ‘0’
   P == ‘1’ && W == ‘1’
   P == ‘0’ && W == ‘0’

STREX

For a description of this instruction and the encoding, see STREX on page F7-3132.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If d == t, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

- If d == n, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.

- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

- If the instruction specifies that t2==15, then the requirements described in Using R15 on page J1-5363 apply.

STREXB

For a description of this instruction and the encoding, see STREXB on page F7-3134.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If d == t, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

- If d == n, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.

- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

- If the instruction specifies that t2==15, then the requirements described in Using R15 on page J1-5363 apply.

STREXD

For a description of this instruction and the encoding, see STREXD on page F7-3136.
CONSTRANDED UNPREDICTABLE behavior

For all encodings:

- If $d = t$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction executes, but the value stored is UNKNOWN.

- If $d = n$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store to an UNKNOWN address.

- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

- If the instruction specifies that $t2 == 15$, then the requirements described in Using R15 on page J1-5363 apply.

For the A1 encoding:

- If $Rt<0> == '1'$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if $Rt<0> == '0'$.
  - The register accessed are both specified by $Rt$. For example, $Rt$ and $Rt+1$ are the same, and both have $bit[0] == 1$.
  - The registers accessed are specified by $Rt$ and $R+1$.

STREXH

For a description of this instruction and the encoding, see STREXH on page F7-3138.

CONSTRANDED UNPREDICTABLE behavior

For all encodings:

- If $d = t$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction executes, but the value stored is UNKNOWN.

- If $d = n$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store to an UNKNOWN address.

- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

- If the instruction specifies that $t2 == 15$, then the requirements described in Using R15 on page J1-5363 apply.

STLEX

For a description of this instruction and the encoding, see STLEX on page F7-3093.
CONSTRANDED UNPREDICTABLE behavior

For all encodings:

• If \( d = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

• If \( d = n \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.

• If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

• If the instruction specifies that \( t2==15 \), then the requirements described in *Using R15 on page J1-5363* apply.

STLEXB

For a description of this instruction and the encoding, see *STLEXB on page F7-3095*.

CONSTRANDED UNPREDICTABLE behavior

For all encodings:

• If \( d = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

• If \( d = n \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.

• If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

• If the instruction specifies that \( t2==15 \), then the requirements described in *Using R15 on page J1-5363* apply.

STLEXD

For a description of this instruction and the encoding, see *STLEXD on page F7-3097*.

CONSTRANDED UNPREDICTABLE behavior

For all encodings:

• If \( d = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

• If \( d = n \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.
• If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

• If the instruction specifies that $t2=15$, then the requirements described in *Using R15 on page J1-5363* apply.

For the A1 encoding:

• If $Rt<0>='1'$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The behavior is the same as if $Rt<0>='0'$.
  — The register accessed are both specified by $Rt$. For example, $Rt$ and $Rt+1$ are the same, and both have bit[0] == 1.
  — The registers accessed are specified by $Rt$ and $R+1$.

STLEXH

For a description of this instruction and the encoding, see *STLEXH on page F7-3099*.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If $d == t$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

• If $d == n$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.

• If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

• If the instruction specifies that $t2=15$, then the requirements described in *Using R15 on page J1-5363* apply.

### J1.1.27 CONSTRAINED UNPREDICTABLE behavior for A32 and T32 system instructions in the base instruction set

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A32 and T32 system instructions.

—— Note ————

If an instruction can result in CONSTRAINED UNPREDICTABLE behavior that is not specific to that particular instruction, see the relevant section in this appendix for a description of the CONSTRAINED UNPREDICTABLE behavior.

———- ————

**CPS (A32)**

For a description of this instruction and the encoding, see *CPS, CPSID, CPSIE on page F7-2720*.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes an illegal exception return by not changing the mode, and setting PSTATE.IL to 1.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors
J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

Note
— An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.
— CPS executed from User mode acts as a NOP.

For the A1 encoding:
• If \((\text{imod} \equiv '00' \& \& \text{M} == '0') || \text{imod} == '01')\), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
• If \(\text{mode} != '0000' \& \& \text{M} == '0')\), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as if \(\text{M} == '1')\).
  — The instruction operates as if \(\text{mode} == '0000')\).
• If \((\text{imod}<1> == '1' \& \& \text{A:I:F} == '000')\), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction behaves as if \(\text{imod}<1> == '0')\).
  — The instruction behaves as if \(\text{A:I:F} \) had an UNKNOWN nonzero value.
• If \((\text{imod}<1> == '0' \& \& \text{A:I:F} != 000)\) then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction behaves as if \(\text{imod}<1> == '1')\).
  — The instruction behaves as if \(\text{A:I:F} == 000\).

CPS (T32)
For a description of this instruction and the encoding, see CPS, CPSID, CPSIE on page F7-2720.

CONSTRAINED UNPREDICTABLE behavior
For all encodings:
• If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

Note
— An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.
— CPS executed from User mode acts as a NOP.

For the T1 encoding:
• If \(\text{A:I:F} == '000')\), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.

For the T2 encoding:
• If \(\text{imod} == '01')\), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
• If mode \(!= '00000' \&\& M == '0'\), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as if \(M == '1'\).
  — The instruction behaves as if \(\text{mode} == '0000'\).

• If \((\text{imod}<1> == '1' \&\& A:I:F == '000')\), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction behaves as if \(\text{imod}<1> == '0'\).
  — The instruction behaves as if \(A:I:F\) had an UNKNOWN nonzero value.

• If \((\text{imod}<1> == '0' \&\& A:I:F != '000')\) then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction behaves as if \(\text{imod}<1> == '1'\).
  — The instruction behaves as if \(A:I:F == '000'\).

**LDM (exception return)**

For a description of this instruction and the encoding, see *LDM (exception return)* on page F7-2774.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.

• If \(\text{wback} \&\& \text{registers<n>} == '1'\), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all the loads using the specified addressing mode and the content of the
    register being written back is UNKNOWN. In addition, if an exception occurs during the execution
    of this instruction, the base address might be corrupted so that the instruction cannot be repeated.

• If the instruction transfers an illegal mode encoding PSTATE.M, then this invokes the illegal exception
  return.

  **Note**

An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current
Exception level.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors

J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

LDM (User registers)

For a description of this instruction and the encoding, see LDM (User registers) on page F7-2776.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If BitCount(registers) < 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

- If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

MRS

For a description of this instruction and the encoding, see MRS on page F7-2892.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If this instruction is executed in User mode or in System mode and is accessing the SPSR, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

MSR (immediate)

For a description of this instruction and the encoding, see MSR (immediate) on page F7-2900.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If the instruction is executed in User mode or in System mode and is accessing the SPSR, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

- If mask == '0000' && R == '1', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

  If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

**Note**

An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors

J1.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

MSR (register)

For a description of this instruction and the encoding, see MSR (register) on page F7-2902.

CONSTRANED UNPREDICTABLE behavior

For all encodings:

• If this instruction is executed in User mode or in System mode and is accessing the SPSR, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.

• If mask == ‘0000’, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.

If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

   — Note ————
     An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

RFE

For a description of this instruction and the encoding, see RFE, RFEDA, RFEDB, RFEIA, RFEIB on page F7-2976.

CONSTRANED UNPREDICTABLE behavior

For all encodings:

• If this instruction is executed in User mode, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.

• If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return.

   — Note ————
     An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

SRS (T32)

For a description of this instruction and the encoding, see SRS, SRSDA, SRSDB, SRSIA, SRSIB on page F7-3074.

CONSTRANED UNPREDICTABLE behavior

For all encodings:

• If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.

• If the instruction specifies an illegal mode field, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
— R13 of the current mode is used.
— The store occurs to an UNKNOWN address, and if the instruction specifies writeback, any general-purpose register that can be accessed without privilege violation from the current Exception level become UNKNOWN.

SRS (A32)

For a description of this instruction and the encoding, see SRS, SRSDA, SRSDB, SRSIA, SRSIB on page F7-3074.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.

• If the instruction specifies an illegal mode field, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — R13 of the current mode is used.
  — The store occurs to an UNKNOWN address, and if the instruction specifies writeback, any general-purpose register that can be accessed without privilege violation from the current Exception level become UNKNOWN.

STM (User registers)

For a description of this instruction and the encoding, see STM (User registers) on page F7-3104.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If $\text{BitCount(}\text{registers}\text{)} < 1$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

• If the instruction is executed from User mode or System mode, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.
CONSTRANDED UNPREDICTABLE behavior

For all encodings:

• If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.

• If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return.

    Note
    An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.

For this encoding:

• If hw2[3:0] are 0b1110, and the instruction is executed when not in Hyp mode, System mode, or User mode, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction is treated as if hw2[3:0] are 0b1110.
  — The program counter is set using the value in the register specified by hw2[3:0].

CONSTRANDED UNPREDICTABLE behavior

For all encodings:

• If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.

• If the instruction transfers an illegal mode encoding to PSTATE.M, then this invokes the illegal exception return.

    Note
    An illegal mode encoding is either an unallocated mode encoding or one that is not accessible at the current Exception level.
J1.1.28  CONSTRANIED UNPREDICTABLE behavior, A32 and T32 Advanced SIMD and floating-point instructions

This section lists the CONSTRANIED UNPREDICTABLE behavior for the different A32 and T32 Advanced SIMD and floating-point instructions listed in Alphabetical list of floating-point and Advanced SIMD instructions on page F8-3272.

Note

• The pseudocode used in this section to describe cases that can result in CONSTRANIED UNPREDICTABLE behavior does not necessarily match the encoding specific pseudocode for a specific instruction.

• If an instruction can result in CONSTRANIED UNPREDICTABLE behavior that is not specific to that particular instruction, see the relevant section in this appendix for a description of the CONSTRANIED UNPREDICTABLE behavior.

VCVT (between floating-point and fixed-point)

For a description of this instruction and the encoding, see VCVT (between floating-point and fixed-point, floating-point) on page F8-3402.

CONSTRANIED UNPREDICTABLE behavior

For all encodings:

• If frac_bits < 0, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The result of the conversion is UNKNOWN.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRANIED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRANIED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRANIED UNPREDICTABLE.

VLD1 (multiple single elements)

For a description of this instruction and the encoding, see VLD1 (multiple single elements) on page F8-3462.

CONSTRANIED UNPREDICTABLE behavior

For all encodings:

• If d+regs > 32, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRANIED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRANIED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRANIED UNPREDICTABLE.
VLD1 (single element to all lanes)

For a description of this instruction and the encoding, see VLD1 (single element to all lanes) on page F8-3459.

CONSTRANDED UNPREDICTABLE behavior

For all encodings:

- If d+regs > 32, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRANDED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRANDED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRANDED UNPREDICTABLE.

VLD2 (multiple 2-element structures)

For a description of this instruction and the encoding, see VLD2 (multiple 2-element structures) on page F8-3471.

CONSTRANDED UNPREDICTABLE behavior

For all encodings:

- If d2+regs > 32, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRANDED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRANDED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRANDED UNPREDICTABLE.

VLD2 (single 2-element structure to one lane)

For a description of this instruction and the encoding, see VLD2 (single 2-element structure to one lane) on page F8-3465.

CONSTRANDED UNPREDICTABLE behavior

For all encodings:

- If d2 > 31, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRANDED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRANDED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRANDED UNPREDICTABLE.
VLD2 (single 2-element structure to all lanes)

For a description of this instruction and the encoding, see VLD2 (single 2-element structure to all lanes) on page F8-3468.

CONstrained UNPREDICTABLE behavior

For all encodings:

• If $d_2 > 31$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRUANCED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRUANCED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRUANCED UNPREDICTABLE.

VLD3 (multiple 3-element structures)

For a description of this instruction and the encoding, see VLD3 (multiple 3-element structures) on page F8-3480.

CONstrained UNPREDICTABLE behavior

For all encodings:

• If $d_3 > 31$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRUANCED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRUANCED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRUANCED UNPREDICTABLE.

VLD3 (single 3-element structure to one lane)

For a description of this instruction and the encoding, see VLD3 (single 3-element structure to one lane) on page F8-3474.

CONstrained UNPREDICTABLE behavior

For all encodings:

• If $d_3 > 31$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRUANCED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRUANCED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRUANCED UNPREDICTABLE.
VLD3 (single 3-element structure to all lanes)

For a description of this instruction and the encoding, see VLD3 (single 3-element structure to all lanes) on page F8-3477.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d + \text{regs} > 32 \), then one of the following behaviors can occur:
  1. The instruction is UNDEFINED.
  2. The instruction executes as a NOP.
  3. One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VLD4 (multiple 4-element structures)

For a description of this instruction and the encoding, see VLD4 (multiple 4-element structures) on page F8-3489.

**CONSTRAINED UNPREDICTABLE behavior**

If \( d3 > 31 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VLD4 (single 4-element structure to one lane)

For a description of this instruction and the encoding, see VLD4 (single 4-element structure to one lane) on page F8-3483.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d4 > 31 \), then one of the following behaviors can occur:
  1. The instruction is UNDEFINED.
  2. The instruction executes as a NOP.
  3. One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.
**VLD4 (single 4-element structure to all lanes)**

For a description of this instruction and the encoding, see *VLD4 (single 4-element structure to all lanes)* on page F8-3486.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d4 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VLDM**

For a description of this instruction and the encoding, see *VLDM, VLDMDB, VLDMIA* on page F8-3492.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( \text{regs} == 0 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a VLDM or a VPOP with the same addressing mode but loads no registers.

- If the register list includes a register that is out of range, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD&FP registers become UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

**Note**

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register specified as D16-D31 with an odd value of \( \text{imm8} \).

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.
VPOP

For a description of this instruction and the encoding, see VPOP on page F8-3612.

CONSTRUCTED UNPREDICTABLE behavior

For all encodings:

- If regs == 0, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a VLDM or a VPOP with the same addressing mode but loads no registers.

- If the register list includes a register that is out of range, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD&FP registers become UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Note

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register specified as D16-D31 with an odd value of imm8.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRUCTED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRUCTED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRUCTED UNPREDICTABLE.

VMOV (between two general-purpose registers and two single-precision registers)

For a description of this instruction and the encoding, see VMOV (between two general-purpose registers and two single-precision registers) on page F8-3552.

CONSTRUCTED UNPREDICTABLE behavior

For all encodings:

- If to_arm_registers & t == t2, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register becomes UNKNOWN.

- If m == 31, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD&FP single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.
VMOV (between two general-purpose registers and a doubleword floating-point register)

For a description of this instruction and the encoding, see VMOV (between two general-purpose registers and a doubleword floating-point register) on page F8-3537.

CONSTRANGED UNPREDICTABLE behavior

For all encodings:

- If \( t_0 \) \& \& \( t = t_2 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register becomes UNKNOWN.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRANGED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRANGED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRANGED UNPREDICTABLE.

VMRS

For a description of this instruction and the encoding, see VMRS on page F8-3558.

CONSTRANGED UNPREDICTABLE behavior

For all encodings:

- If \( t = 15 \) \& \& \( \text{reg} != '0001' \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction transfers an UNKNOWN value to the specified general-purpose register.

In addition, CheckVFPEnabled(FALSE) can be called by this instruction for the CONSTRANGED UNPREDICTABLE cases.

VMSR

For a description of this instruction and the encoding, see VMSR on page F8-3560.

CONSTRANGED UNPREDICTABLE behavior

For all encodings:

- If \( \text{reg} != '000x' \) \& \& \( \text{reg} != '1000' \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction transfers the value in the general-purpose register to one of the allocated registers accessible using VMSR at the same Exception level.

In addition, CheckVFPEnabled(FALSE) can be called by this instruction for the CONSTRANGED UNPREDICTABLE cases.
VST1 (multiple single elements)

For a description of this instruction and the encoding, see \textit{VST1 (multiple single elements)} on page F8-3750.

\textbf{CONSTRAINED UNPREDICTABLE behavior}

For all encodings:

- If \( d + \text{regs} > 32 \), then one of the following behaviors can occur:
  - The instruction is \textit{UNDEFINED}.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become \textit{UNKNOWN}. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not \textit{UNDEFINED}, then whether it is affected by traps or enables relating to the use of the SIMD\&FP registers when it is \textit{CONSTRAINED UNPREDICTABLE}, is \textit{IMPLEMENTATION DEFINED}. The implementation must ensure that the \textit{CONSTRAINED UNPREDICTABLE} behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not \textit{CONSTRAINED UNPREDICTABLE}.

VST2 (multiple 2-element structures)

For a description of this instruction and the encoding, see \textit{VST2 (multiple 2-element structures)} on page F8-3756.

\textbf{CONSTRAINED UNPREDICTABLE behavior}

For all encodings:

- If \( d2 + \text{regs} > 32 \), then one of the following behaviors can occur:
  - The instruction is \textit{UNDEFINED}.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become \textit{UNKNOWN}. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not \textit{UNDEFINED}, then whether it is affected by traps or enables relating to the use of the SIMD\&FP registers when it is \textit{CONSTRAINED UNPREDICTABLE}, is \textit{IMPLEMENTATION DEFINED}. The implementation must ensure that the \textit{CONSTRAINED UNPREDICTABLE} behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not \textit{CONSTRAINED UNPREDICTABLE}.

VST2 (single 2-element structure from one lane)

For a description of this instruction and the encoding, see \textit{VST2 (single 2-element structure from one lane)} on page F8-3753.

\textbf{CONSTRAINED UNPREDICTABLE behavior}

For all encodings:

- If \( d2 > 31 \), then one of the following behaviors can occur:
  - The instruction is \textit{UNDEFINED}.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become \textit{UNKNOWN}. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.
If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VST3 (multiple 3-element structures)**

For a description of this instruction and the encoding, see *VST3 (multiple 3-element structures)* on page F8-3762.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d3 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VST3 (single 3-element structure from one lane)**

For a description of this instruction and the encoding, see *VST3 (single 3-element structure from one lane)* on page F8-3759.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d3 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.
VST4 (multiple 4-element structures)

For a description of this instruction and the encoding, see *VST4 (multiple 4-element structures)* on page F8-3768.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d4 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VST4 (single 4-element structure from one lane)

For a description of this instruction and the encoding, see *VST4 (single 4-element structure from one lane)* on page F8-3765.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d4 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VSTM

For a description of this instruction and the encoding, see *VSTM, VSTMDB, VSTMIA* on page F8-3771.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( \text{regs} = 0 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a VSTM or VPUSH with the same addressing mode but loads no registers.
• If the register list includes a register that is out of range, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

________ Note ________

Out of range means that the register list includes:
• A register with a number greater than the number of registers implemented.
• More than 16 double word registers.
• A double word register specified as D16-D31 with an odd value of imm8.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VPUSH

For a description of this instruction and the encoding, see VPUSH on page F8-3614.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:
• If regs == 0, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as a VSTM or VPUSH with the same addressing mode but loads no registers.
• If the register list includes a register that is out of range, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

________ Note ________

Out of range means that the register list includes:
• A register with a number greater than the number of registers implemented.
• More than 16 double word registers.
• A double word register specified as D16-D31 with an odd value of imm8.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE, is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.
VTBL, VTBX

For a description of this instruction and the encoding, see VTBL, VTBX on page F8-3790.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( n + \text{length} > 32 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD&FP registers become UNKNOWN. This behavior does not affect any general-purpose registers.

### J1.1.29 CONSTRANDED UNPREDICTABLE behaviors associated with the VTCR

The following subsections describe the CONSTRAINED UNPREDICTABLE behavior associated with programming the VTCR:

- **VTCR.S**
- **CONSTRAINED UNPREDICTABLE combinations of the starting level and size fields.**

**VTCR.S**

VTCR.S must be programmed to T0SZ[3], or the effect is CONSTRAINED UNPREDICTABLE. For the ARMv8-A architecture, if VTCR.S is not programmed correctly, then the stage 2 T0SZ value is treated as an UNKNOWN value.

**CONSTRAINED UNPREDICTABLE combinations of the starting level and size fields**

If the stage 2 input address size, as programmed in VTCR.T0SZ, is out of range with respect to the starting level, as programmed in the VTCR.SL0 field at the time of a translation walk that uses the stage 2 translation, then a stage 2 First level Translation Fault is generated.

### J1.1.30 CONSTRANDED UNPREDICTABLE behavior in Debug state

Behavior in Debug state on page H2-4988 of this manual describes the CONSTRAINED UNPREDICTABLE behaviors that are specifically associated with Debug state.
J1.31 CONSTRANDED UNPREDICTABLE behavior of EL2 features

The following sections describe CONSTRANDED UNPREDICTABLE behavior that can occur in an implementation that includes EL2 where EL2 can use AArch32:

- **ERET in User mode or System mode.**
- **Accessing Hyp mode from outside Hyp mode.**
- **Modifying PSTATE.M when in Hyp mode**
- **Use of Hyp mode in Secure state.**
- **Instructions which are UNDEFINED or CONSTRANDED UNPREDICTABLE in Hyp mode on page J1-5437.**
- **Exception return to Hyp mode on page J1-5437.**
- **Accessing registers that cannot be accessed using MSR/MRS instructions on page J1-5437.**
- **Memory type handling on page J1-5437.**
- **Hyp mode TLB maintenance instructions on page J1-5438.**
- **Hyp mode VA to PA address translation instructions on page J1-5438.**
- **Stage 1 default memory type on page J1-5438.**
- **Trapping of general exceptions to Hyp mode on page J1-5438.**
- **Prevention of rootkits using Hyp mode or Secure state on page J1-5439.**
- **HVC on page J1-5439.**
- **MSR/MRS banked registers on page J1-5439.**

**ERET in User mode or System mode**

If ERET is executed in User mode or System mode, it behaves as described in **SUBS PC, LR and related instructions (T32)** on page J1-5423.

**Accessing Hyp mode from outside Hyp mode**

Attempting to change into Hyp mode or out of Hyp mode using the MSR or CPS instruction invokes the ARMv8 illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

SRS using the Hyp mode SP from Non-secure modes other than Hyp mode, or from Secure state, is handled as described in **SRS (T32)** on page J1-5421 and **SRS (A32)** on page J1-5422.

**Modifying PSTATE.M when in Hyp mode**

Attempting to change into Hyp mode or out of Hyp mode using the MSR or CPS instruction invokes the ARMv8 illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

SRS using the Hyp mode SP from Non-secure modes other than Hyp mode, or from Secure state, is handled as described in **SRS (T32)** on page J1-5421 and **SRS (A32)** on page J1-5422.

**Use of Hyp mode in Secure state**

Attempting to change into Hyp mode or out of Hyp mode using the MSR or CPS instruction invokes the ARMv8 illegal exception return by not changing the mode, and setting PSTATE.IL to 1.

SRS using the Hyp mode SP from Non-secure modes other than Hyp mode, or from Secure state, is handled as described in **SRS (T32)** on page J1-5421 and **SRS (A32)** on page J1-5422.
Instructions which are UNDEFINED or CONSTRAINED UNPREDICTABLE in Hyp mode

If LDRT, LDRSHT, LDRHT, LDRSBT, LDRBT, STRT, STRHT or STRBT are executed in Hyp mode, then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the equivalent, corresponding LDR, LDRSH, LDRH, LDRSB, LDRB, STR, STRH or STRB instruction in Hyp mode.

Exception return to Hyp mode

Exception returns to Hyp mode when SCR.NS == 0 or from a Non-secure PL1 mode invokes the ARMv8 illegal exception return.

Accessing registers that cannot be accessed using MSR/MRS instructions

The following MSR and MRS instructions can lead to CONSTRAINED UNPREDICTABLE behavior:

MSR <Rm>_<mode>, <Rn>
MSR SPSR_<mode>, <Rn>
MSR ELR_hyp, <Rn>
MRS <Rn>, <Rm>_<mode>
MRS <Rn>, SPSR_<mode>
MRS <Rn>, ELR_hyp

If these instructions are executed in either Secure or Non-secure User mode, then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.

If the MSR and MRS instructions attempt to access a register that cannot be legally accessed, then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• For MRS instructions, the destination general-purpose register becomes UNKNOWN.
• For MSR instructions, if the register specified could be accessed from the current mode by other mechanisms, then this register is UNKNOWN. Otherwise the instruction executes as a NOP.

Memory type handling

If the attributes for a memory location after combining stage 1 and stage 2 of a translation regime is Normal Inner Non-cacheable, Outer Non-cacheable, then the shareability attributes after combining the two stages of translation is Outer Shareable.
Hyp mode TLB maintenance instructions

If a TLBIMVAH, TLBIMVALH, TLBIMVAHIS, TLBIMVALHIS, TLBIALLNSNH, TLBIALLNSNHIS, TLBIALLLH, or a TLBIALLLHIS instruction is executed in a Secure Privileged mode other than Monitor mode, then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction is executed as if it had been executed in Monitor mode.

For more information about these instructions see The scope of TLB maintenance instructions on page G4-4142.

Hyp mode VA to PA address translation instructions

If an ATS1HR or ATS1HW instruction is executed in a Secure Privileged mode other than Monitor mode, then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction is executed as if it had been executed in Monitor mode.

For more information about these instructions see Naming of the address translation instructions, and operation summary on page G4-4182.

Stage 1 default memory type

If HCR.DC == 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with:
- SCTLR.M == 0, regardless of the actual value of SCTLR.M, other than for the value returned by an explicit read of SCTLR.M.
- HCR.VM == 1, regardless of the actual value of HCR.VM, other than for an explicit read of this bit.

Trapping of general exceptions to Hyp mode

Attempting to perform an exception return to a Non-secure PL1 mode when HCR.TGE == 1 invokes an illegal exception return.

Attempting to change from Monitor mode to a Non-secure PL1 mode when HCR.TGE == 1 by executing a CPS or MSR instruction generates an Illegal Execution State exception, by not changing the mode, and setting PSTATE.IL to 1.

When EL3 is using AArch32, attempting to change from a Secure PL1 mode to a Non-secure PL1 mode when HCR.TGE is set, by changing SCR.NS from 0 to 1, results in no change of SCR.NS

Because taking an exception into Non-secure PL1 modes leads to a CONSTRAINED UNPREDICTABLE situation, the following additional properties apply when HCR.TGE == 1:
- All exceptions that would be routed to EL1 are routed to EL2.
- Non-secure SCTLR.M is treated as being 0, regardless of its actual value, other than for an explicit read of this bit.
- HCR.FMO, HCR.IMO, and HCR.AMO are treated as being 1, regardless of their actual value, other than for an explicit read of these bits.
- All virtual interrupts are disabled.
- Any IMPLEMENTATION DEFINED mechanisms for signalling virtual interrupts are disabled.
Prevention of rootkits using Hyp mode or Secure state

If an HVC instruction is executed in Hyp mode when SCR.HCE == 0, then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.

If an SMC instruction is executed in a Secure privileged mode when SCR.SCD == 1, then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.

HVC

For a description of this instruction and the encoding, see HVC on page F7-2746.

For the A1 encoding, if cond field != 1110, then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

MSR/MRS banked registers

Some unallocated encodings for the MSR/MRS banked register instructions can cause CONSTRAINED UNPREDICTABLE behavior. If an unallocated encoding for the MSR/MRS banked register instructions is executed, then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- An allocated MSR/MRS banked register instruction is executed.
J1.2 Constraints on AArch64 state UNPREDICTABLE behaviors

It contains the following sections:

- Overview of the constraints on AArch64 UNPREDICTABLE behaviors.
- Reserved values in system registers and translation table entries.
- CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values.
- CONSTRAINED UNPREDICTABLE behavior due to inadequate context synchronization on page J1-5441.
- Translation table base address alignment on page J1-5441.
- Performance Counters on page J1-5441.
- Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED on page J1-5442.
- Out of range virtual address on page J1-5442.
- Instruction fetches from Device memory on page J1-5443.
- Programming the CSSEL_EL1.Level for a cache level that is not implemented on page J1-5443.
- Crossing a page boundary with different memory types or shareability attributes on page J1-5443.
- Crossing a peripheral boundary with a Device access on page J1-5443.
- CONSTRAINED UNPREDICTABLE behavior in Debug state on page J1-5444.
- CONSTRAINED UNPREDICTABLE behavior for A64 instructions on page J1-5444.
- Out of range values of the Set/Way/Index fields in cache maintenance instructions on page J1-5451.

J1.2.1 Overview of the constraints on AArch64 UNPREDICTABLE behaviors

The term UNPREDICTABLE describes a number of cases where the architecture has a feature that software must not use. For execution in AArch64 state, the ARMv8-A architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

_______ Note _________

Software designed to be compatible with the ARMv8-A architecture must not rely on these CONSTRAINED UNPREDICTABLE cases being handled in any way other than those listed under the heading CONSTRAINED UNPREDICTABLE.

J1.2.2 Reserved values in system registers and translation table entries

Unless otherwise stated in this manual, all unallocated or reserved values of fields with allocated values within system registers and translation table entries behave in one of the following ways:

- The unallocated value maps onto any of the allocated values, but otherwise does not cause CONSTRAINED UNPREDICTABLE behavior.
- The unallocated value causes effects that could be achieved by a combination of more than one of the allocated values.
- The unallocated value causes the field to have no functional effect.

J1.2.3 CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values

The ARM architecture allows copies of control values or data values to be cached in a cache or TLB. This can lead to UNPREDICTABLE behavior if the cache or TLB has not been correctly invalidated following a change of the control or data values. Unless explicitly stated otherwise, the behavior of the PE is consistent with:

- The old data or control value.
- The new data or control value.
- An amalgamation of the control or data values.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors

J1.2 Constraints on AArch64 state UNPREDICTABLE behaviors

Note
This rule applies where inadequate invalidation of the TLB might cause multiple hits within the TLB. In this situation, a failure to invalidate the TLB by code running at a given Privilege level must not make access to regions of memory with permissions or attributes that could not be accessed at that Privilege level possible.

Alternatively, an implementation might generate a Data Abort exception when detecting multiple hits within a TLB, using the TLB Conflict fault code.

The choice between these behaviors might, in some implementations, vary for each use of a control or data value.

### J1.2.4 CONstrained UNpREDICTABLE behavior due to inadequate context synchronization

The ARM architecture requires that changes to system registers must be synchronized before they take effect. This can lead to UNPREDICTABLE behavior if the synchronization has not been performed.

In these cases, the behavior of the processor is consistent with the unsynchronized control value being either the old value or the new value.

Where multiple control values are updated but not yet synchronized, each control value might independently be the old value or the new value.

In addition, where the unsynchronized control value applies to different areas of functionality, or what an implementation has constructed as different areas of functionality, those areas might independently treat the control value as being either the old value or the new value.

The choice between these behaviors might, in some implementations, vary for each use of a control value.

### J1.2.5 Translation table base address alignment

Field [x-1:0] in TTBR0_EL1, TTBR1_EL1, TTBR0_EL2, VTTBR_EL2, or TTBR0_EL3 is RES0. If this field does not have a value of 0, this might result in a misaligned translation table base address. In this case, one of the following behaviors can occur:

- The field that is defined to be RES0 is treated as if all the bits had a value of 0:
  - The value read back might be the value written or it might be 0.

- The calculation of an address for a translation table walk using those registers can be corrupted in those bits that are nonzero.

### J1.2.6 Performance Counters

The following cases can cause CONstrained UNpREDICTABLE behavior:

- If PMSEL_EL0.SEL is not equal to 31, and PMSEL_EL0.SEL is greater than or equal to PMCR_EL0.N, and the PE is executing in an Exception level in Secure state or in EL2.

- If PMSEL_EL0.SEL is not 31, and PMSEL_EL0.SEL is greater than or equal to MDCR_EL2.HPMN, and the PE is executing in an Exception level in Non-secure state other than in EL2.

In these cases, one of the following behaviors can occur:

- Any access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state is UNDEFINED.

- Any access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state executes as a NOP.

- Any access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 from that state either:
  - Ignores writes and returns 0 on reads.
  - Behaves as if PMSEL_EL0.SEL contains an UNKNOWN value that is less than PMCR_EL0.N and the PE is executing in an Exception level in Secure state or in EL2, or behaves as if PMSEL_EL0.SEL contains an UNKNOWN value that is less than MDCR_EL2.HPMN if the PE executing in an Exception level in Non-secure state other than in EL2.
If PMSELR_EL0.SEL is equal to 31, then one of the following behaviors can occur:

- Any access to PMXEVCNTR_EL0 is UNDEFINED.
- Any access to PMXEVCNTR_EL0 executes as a NOP.
- Any access to PMXEVCNTR_EL0 either:
  - Ignores writes and returns 0 on reads.
  - Behaves as if PMSELR_EL0.SEL contains an UNKNOWN value that is less than PMCR_EL0.N and the PE is executing in an Exception level in Secure state or in EL2, or behaves as if PMSELR_EL0.SEL contains an UNKNOWN value that is less than MDCR_EL2.HPMN if the PE is executing in an Exception level in Non-secure state other than in EL2.

If MDCR_EL2.HPMN is greater than PMCR_EL0.N, then the behavior is as if MDCR_EL2.HPMN contains an UNKNOWN value less than or equal to the value of PMCR_EL0.N. However, the value read back from MDCR_EL2.HPMN is the actual value.

If MDCR_EL2.HPMN is 0, then the behavior is either:

- As if MDCR_EL2.HPMN contains an UNKNOWN value less than or equal to PMCR_EL0.N. However, the value read back from MDCR_EL2.HPMN is the actual value.
- As if it were not UNPREDICTABLE.

**J1.2.7 Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED**

When a CONSTRAINED UNPREDICTABLE instruction is treated as UNDEFINED, ESR_ELx is UNKNOWN.

---

**Note**

The value written to ESR_ELx must be consistent with a value that could be created as the result of an exception from the same Exception level that generated the exception, but was the result of a situation that is not CONSTRAINED UNPREDICTABLE at that Exception level. This is to avoid a possible privilege violation.

---

**J1.2.8 Out of range virtual address**

Because of program counter alignment constraints, it is impossible for a PE to fetch an A64 instruction that includes the bytes at virtual address 0xFFFF FFFF FFFF FFFF and 0x0000 0000 0000 0000.

If the PE executes a load or store instruction with tagged addressing disabled in the current translation regime, and where the computed virtual address, total access size, and alignment mean that it accesses the bytes at 0xFFFF FFFF FFFF FFFF and 0x0000 0000 0000 0000, then the bytes that appear to be from 0x0000 0000 0000 0000 onwards are accessed at an UNKNOWN address.

If the PE executes a load or store instruction with tagged addressing enabled in the current translation regime, and where the computed address, total access size, and alignment mean that it accesses the bytes at 0xFFFF FFFF FFFF FFFF and 0x0000 0000 0000 0000, then the bytes that appear to be from 0x0000 0000 0000 0000 onwards are accessed at an UNKNOWN address and the tags associated with address also become UNKNOWN.
**Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors**

**J1.2 Constraints on AArch64 state UNPREDICTABLE behaviors**

**J1.2.9 Instruction fetches from Device memory**

Instruction fetches from Device memory are CONSTRAINED UNPREDICTABLE.

If a location in memory has the Device attribute and is not marked as execute-never, then an implementation might perform speculative instruction accesses to this memory location at times when the MMU is enabled.

If a branch causes the program counter to point to an area of memory with the Device attribute that is not marked as execute-never for the current Exception level for instruction fetches, then an implementation can perform one of the following behaviors:

- It can treat the instruction fetch as if it were to a memory location with the Normal, Non-cacheable attribute.
- It can take a Permission fault.

**J1.2.10 Programming the CSSELR_EL1.Level for a cache level that is not implemented**

If the CSSELR_EL1.Level is programmed to a cache level that is not implemented, then a read of CSSELR_EL1 returns an UNKNOWN value in CSSELR_EL1.Level.

If the CSSELR_EL1.Level is programmed to a cache level that is not implemented, then on a read of CCSIDR_EL1 an implementation can perform one of the following behaviors:

- The CCSIDR_EL1 read executes as a NOP.
- The CCSIDR_EL1 read is UNDEFINED.
- The CCSIDR_EL1 read returns an UNKNOWN value.

**J1.2.11 Crossing a page boundary with different memory types or shareability attributes**

A memory access from a load or store instruction that crosses a page boundary to a memory location that has a different type or shareability attribute results in CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation can perform one of the following behaviors:

- All memory accesses generated by the instruction use the memory type and shareability attributes associated with the first address accessed by the instruction.
- All memory accesses generated by the instruction use the memory type and shareability attributes associated with the last address accessed by the instruction.
- Each memory access generated by the instruction uses the memory type and shareability attribute associated with its own address.
- The instruction generates an Alignment fault.
- The instruction executes as a NOP.

**J1.2.12 Crossing a peripheral boundary with a Device access**

Performing memory accesses from one load or store instruction to Device memory that crosses a boundary corresponding to the smallest translation granule size of the implementation causes CONSTRAINED UNPREDICTABLE behavior. In this case, the implementation can perform one of the following behaviors:

- All memory accesses generated by the instruction are performed as if the presence of the boundary had no effect on the memory accesses.
- All memory accesses generated by the instruction are performed as if the presence of the boundary had no effect on the memory accesses, except that there is no guarantee of ordering between memory accesses.
- The instruction generates an Alignment fault caused by the memory type, which, where two stages of translation are in use, is taken to EL1 if Stage 1 has generated the mismatch, and to EL2 if stage 2 has generated the mismatch. If both stages generate the mismatch, the exception can be taken to either exception level.
- The instruction executes as a NOP.
J1.2.13 CONSTRAINED UNPREDICTABLE behavior in Debug state

Behavior in Debug state on page H2-4988 of this manual describes the CONSTRAINED UNPREDICTABLE behaviors that are specifically associated with Debug state.

J1.2.14 CONSTRAINED UNPREDICTABLE behavior for A64 instructions

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A64 instructions listed in Chapter C6 A64 Base Instruction Descriptions and Chapter C7 A64 Advanced SIMD and Floating-point Instruction Descriptions.

LDR (immediate)

For a description of this instruction and the encoding, see LDR (immediate) on page C6-533.

CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \( n = t \text{ and } n \neq 31 \), then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

——— Note ————
Pre-indexed and post-indexed addressing implies writeback.

LDRB (immediate)

For a description of this instruction and the encoding, see LDRB (immediate) on page C6-542.

CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \( n = t \text{ and } n \neq 31 \), then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

——— Note ————
Pre-indexed and post-indexed addressing implies writeback.
LDRH (immediate)

For a description of this instruction and the encoding, see LDRH (immediate) on page C6-548.

CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and $n == t \&\& n != 31$, then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

—— Note ———
Pre-indexed and post-indexed addressing implies writeback.

LDRSB (immediate)

For a description of this instruction and the encoding, see LDRSB (immediate) on page C6-554.

CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and $n == t \&\& n != 31$, then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

—— Note ———
Pre-indexed and post-indexed addressing implies writeback.

LDRSH (immediate)

For a description of this instruction and the encoding, see LDRSH (immediate) on page C6-560.

CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and $n == t \&\& n != 31$, then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

—— Note ———
Pre-indexed and post-indexed addressing implies writeback.
LDRSW (immediate)

For a description of this instruction and the encoding, see *LDRSW (immediate)* on page C6-566.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \( n = t \& n \neq 31 \), then one of the following behaviors can occur:

* The instruction is UNDEFINED.
* The instruction executes as a NOP.
* The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

---

**Note**

Pre-indexed and post-indexed addressing implies writeback.

---

LDP

For a description of this instruction and the encoding, see *LDP* on page C6-526.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \((t = n || t2 = n) \& n \neq 31\), then one of the following behaviors can occur:

* The instruction is UNDEFINED.
* The instruction executes as a NOP.
* The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

If \( t = t2 \), then one of the following behaviors can occur:

* The instruction is UNDEFINED.
* The instruction executes as a NOP.
* The instruction performs all of the loads using the specified addressing mode, and the register loaded is set to an UNKNOWN value.

---

**Note**

Pre-indexed and post-indexed addressing implies writeback.

---

LDPSW

For a description of this instruction and the encoding, see *LDPSW* on page C6-530.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \((t = n || t2 = n) \& n \neq 31\), then one of the following behaviors can occur:

* The instruction is UNDEFINED.
* The instruction executes as a NOP.
* The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.
If \( t = t_2 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode, and the register loaded is set to an UNKNOWN value.

---

**Note**

Pre-indexed and post-indexed addressing implies writeback.

---

**LDNP (SIMD&FP)**

For a description of this instruction and the encoding, see [LDNP (SIMD&FP)](#) on page C7-1102.

**CONSTRAINED UNPREDICTABLE behavior**

If \( t = t_2 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

**LDP (SIMD&FP)**

For a description of this instruction and the encoding, see [LDP (SIMD&FP)](#) on page C7-1104.

**CONSTRAINED UNPREDICTABLE behavior**

If \( t = t_2 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

**LDAXP**

For a description of this instruction and the encoding, see [LDAXP](#) on page C6-512.

**CONSTRAINED UNPREDICTABLE behavior**

If \( t = t_2 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

**LDPX**

For a description of this instruction and the encoding, see [LDPX](#) on page C6-600.

**CONSTRAINED UNPREDICTABLE behavior**

If \( t = t_2 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.
STR (immediate)
For a description of this instruction and the encoding, see STR (immediate) on page C6-717.

CONSTRAINED UNPREDICTABLE behavior
If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \( n = t \&\& n \neq 31 \), then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

Note
Pre-indexed and post-indexed addressing implies writeback.

STRB (immediate)
For a description of this instruction and the encoding, see STRB (immediate) on page C6-723.

CONSTRAINED UNPREDICTABLE behavior
If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \( n = t \&\& n \neq 31 \), then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

Note
Pre-indexed and post-indexed addressing implies writeback.

STRH (immediate)
For a description of this instruction and the encoding, see STRH (immediate) on page C6-729.

CONSTRAINED UNPREDICTABLE behavior
If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \( n = t \&\& n \neq 31 \), then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

Note
Pre-indexed and post-indexed addressing implies writeback.
Appendix J1 Architectural Constraints on UNPREDICTABLE behaviors

J1.2 Constraints on AArch64 state UNPREDICTABLE behaviors

STP

For a description of this instruction and the encoding, see STP on page C6-713.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \( t = n \) || \( t2 = n \) \&\& \( n \neq 31 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

**Note**

Pre-indexed and post-indexed addressing implies writeback.

STLXR

For a description of this instruction and the encoding, see STLXR on page C6-702.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) || \( \text{pair} \&\& s = t2 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

STLXRB

For a description of this instruction and the encoding, see STLXRB on page C6-705.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) || \( \text{pair} \&\& s = t2 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

STLXRH

For a description of this instruction and the encoding, see STLXRH on page C6-708.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) || \( \text{pair} \&\& s = t2 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.
If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

**STXR**

For a description of this instruction and the encoding, see *STXR on page C6-751*.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) || (pair \&\& s = t2), then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

**STXRB**

For a description of this instruction and the encoding, see *STXRB on page C6-754*.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) || (pair \&\& s = t2), then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

**STXRH**

For a description of this instruction and the encoding, see *STXRH on page C6-757*.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) || (pair \&\& s = t2), then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.
STLXP

For a description of this instruction and the encoding, see STLXP on page C6-699.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) \( \text{||} \) \((\text{pair} \&\& s = t2)\), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

STXP

For a description of this instruction and the encoding, see STXP on page C6-748.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) \( \text{||} \) \( \text{pair} \&\& s = t2 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the store to an UNKNOWN address.

**J1.2.15 Out of range values of the Set/Way/Index fields in cache maintenance instructions**

In the cache maintenance by set/way instructions DC CISW, DC CSW, and DC ISW, if any set/way/index argument is larger than the value supported by the implementation, then the behavior is **CONstrained UNPRedictable** and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

--- **Note** ---

This **CONStrained UNPRedictable** behavior applies, also, to the AArch32 cache maintenance by set/way instructions DCCISW, DCCSW, and DCISW.
Appendix J2
Recommended External Debug Interface

This appendix describes the recommended external debug interface. It contains the following sections:

- About the recommended external debug interface on page J2-5454.
- PMUEVENT bus on page J2-5457.
- Recommended authentication interface on page J2-5458.
- Management registers and CoreSight compliance on page J2-5461.

Note

This recommended external debug interface specification is not part of the ARM architecture specification. Implementers and users of the ARMv8 architecture must not consider this appendix as a requirement of the architecture. It is included as an appendix to this manual only:

- As reference material for users of ARM products that implement this interface.
- As an example of how an external debug interface might be implemented.

The inclusion of this appendix is no indication of whether any ARM products might, or might not, implement this external debug interface. For details of the implemented external debug interface you must always see the appropriate product documentation.
J2.1 About the recommended external debug interface

See the Note on the first page of this appendix for information about the architectural status of this recommended debug interface.

This specification provides a recommended external debug interface for ARMv8 to define a standard set of connections for validation environments. In general, the connection between components, such as between the PE and Trace extension, is not described here, although the table does include the signals for the CTI connection. Table J2-1 shows the signals in the recommended interface.

a. The value of n depends on the size of the address space occupied by the Debug port.

Figure J2-1 Recommended external debug interface, including the APB3 slave port.
J2.2 PMUEVENT bus

The PMUEVENT bus exports Performance Monitor events from the PE to an on-chip agent. ARM recommends that it has the following characteristics:

- The bus is synchronous.
- The width of the bus is IMPLEMENTATION DEFINED.
- It is IMPLEMENTATION DEFINED which events are exported on the bus.
- Each exported event occupies a contiguous sub-field of the bus. ARM recommends that the sub-fields of the bus are occupied in the same order as the event numbers.
- If the event can only occur once per cycle, it occupies a single bit. If the event can occur more than once per cycle, it is IMPLEMENTATION DEFINED how the event is encoded. The encoding depends on constraints such as the designated use of the event bus and the number of pins available. For example, the event can be encoded:
  - As a count, using a plain binary number. This is the most useful encoding when exporting to an external counter. It is not a useful encoding for exporting to a Trace extension external input.
  - As a count, using thermometer encoding. This is the most useful encoding when exporting to a Trace extension.
  - Using a single bit encoding to indicate whether the event count is zero or nonzero. This is useful for exporting to an activity monitor where the number of pins is constrained.

If a Trace extension is implemented, the PMUEVENT bus is normally connected to the Trace extension using the external inputs. TRCEXTINSELR multiplexes a wide PMUEVENT bus to a narrow set of inputs. An external PMUEVENT bus might also be provided. For more information, contact ARM.
J2.3 Recommended authentication interface

The details of the debug authentication interface are IMPLEMENTATION DEFINED.

ARM recommends the use of the CoreSight interface, which has four signals for external debug authentication:

- DBGEN
- SPIDEN
- NIDEN
- SPNIDEN

CoreSight forbids asserting SPIDEN without also asserting DBGEN. CoreSight also forbids asserting SPNIDEN without also asserting NIDEN.

ARM recommends an interface in which DBGEN and SPIDEN are also used for self-hosted secure debug authentication if either:

- EL3 is using AArch32 and SDCR.SPD == 0b00.
- Secure EL1 is using AArch32 and MDCR_EL3.SPD32 == 0b00.

If EL3 is not implemented and the PE is in Non-secure state, SPIDEN and SPNIDEN are not implemented, and the PE behaves as if these signals were tied LOW.

If EL3 is not implemented and the PE is in Secure state, SPIDEN is usually connected to DBGEN and SPNIDEN is connected to NIDEN, but this is not required. The recommended interface is defined as if all four signals are implemented.

How the authentication signals are driven is IMPLEMENTATION DEFINED. For example, the signals might be hard-wired, connected to fuses, or to an authentication module. The architecture permits PEs within a cluster to have independent authentication interfaces, but this is not required. ARM recommends that any Trace extension has the same authentication interface as the PE it is connected to.

Table J2-2 shows the debug authentication pseudocode functions and the recommended implementations.

<table>
<thead>
<tr>
<th>Pseudocode function</th>
<th>Description</th>
<th>Implementation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SelfHostedSecurePrivilegedInvasiveDebugEnabled()</td>
<td>Secure invasive self-hosted debug enabled in AArch32 state (legacy)</td>
<td>(DBGEN AND SPIDEN)</td>
</tr>
<tr>
<td>See Pseudocode description of AArch32 Self-Hosted Secure Privileged Invasive Debug Enabled on page J2-5459</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ExternalSecureNoninvasiveDebugEnabled()</td>
<td>Secure non-invasive debug enabled</td>
<td>(DBGEN OR NIDEN) AND (SPIDEN OR SPNIDEN)</td>
</tr>
<tr>
<td>See Pseudocode description of External Invasive Debug Enabled on page J2-5459</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ExternalSecureInvasiveDebugEnabled()</td>
<td>Secure invasive debug enabled</td>
<td>(DBGEN AND SPIDEN)</td>
</tr>
<tr>
<td>See Pseudocode description of External Secure Invasive Debug Enabled on page J2-5459</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ExternalNoninvasiveDebugEnabled()</td>
<td>Non-secure non-invasive debug enabled</td>
<td>(DBGEN OR NIDEN)</td>
</tr>
<tr>
<td>See Pseudocode description of External Non-invasive Debug Enabled on page J2-5459</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ExternalInvasiveDebugEnabled()</td>
<td>Non-secure invasive debug enabled</td>
<td>DBGEN</td>
</tr>
<tr>
<td>See Pseudocode description of External Secure Non-invasive Debug Enabled on page J2-5460</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following assertions must apply to all implementations:

if !ExternalInvasiveDebugEnabled() then assert !ExternalSecureInvasiveDebugEnabled()

if !ExternalNoninvasiveDebugEnabled() then assert !ExternalSecureNoninvasiveDebugEnabled()
if ExternalInvasiveDebugEnabled() then assert ExternalNoninvasiveDebugEnabled()

if ExternalSecureInvasiveDebugEnabled() then assert ExternalSecureNoninvasiveDebugEnabled()

The definition for the Debug_authentication() function is as follows:

signal DBGEN;
signal NIDEN;
signal SPIDEN;
signal SPNIDEN;

J2.3.1 Pseudocode description of AArch32 Self-Hosted Secure Privileged Invasive Debug Enabled

The pseudocode for the SelfHostedSecurePrivilegedInvasiveDebugEnabled() function is as follows:

// AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()
// ========================================================

boolean AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()
// In the recommended interface, SelfHostedSecurePrivilegedInvasiveDebugEnabled returns
// the state of the (DBGEN AND SPIDEN) signal.
if !HaveEL(EL3) && !IsSecure() then return FALSE;
return DBGEN == HIGH && SPIDEN == HIGH;

J2.3.2 Pseudocode description of External Invasive Debug Enabled

The pseudocode for the ExternalInvasiveDebugEnabled() function is as follows:

// ExternalInvasiveDebugEnabled()
// =================================

boolean ExternalInvasiveDebugEnabled()
// In the recommended interface, ExternalInvasiveDebugEnabled returns the state of the DBGEN
// signal.
return DBGEN == HIGH;

J2.3.3 Pseudocode description of External Secure Invasive Debug Enabled

The pseudocode for the ExternalSecureInvasiveDebugEnabled() function is as follows:

// ExternalSecureInvasiveDebugEnabled()
// ====================================

boolean ExternalSecureInvasiveDebugEnabled()
// In the recommended interface, ExternalSecureInvasiveDebugEnabled returns the state of the
// (DBGEN AND SPIDEN) signal.
// CoreSight allows asserting SPIDEN without also asserting DBGEN, but this is not recommended.
if !HaveEL(EL3) && !IsSecure() then return FALSE;
return ExternalInvasiveDebugEnabled() && SPIDEN == HIGH;

J2.3.4 Pseudocode description of External Non-invasive Debug Enabled

The pseudocode for the ExternalNoninvasiveDebugEnabled() function is as follows:

// ExternalNoninvasiveDebugEnabled()
// =================================

boolean ExternalNoninvasiveDebugEnabled()
// In the recommended interface, ExternalNoninvasiveDebugEnabled returns the state of the (DBGEN
// OR NIDEN) signal.
return ExternalInvasiveDebugEnabled() || NIDEN == HIGH;
J2.3.5  Pseudocode description of External Secure Non-invasive Debug Enabled

The pseudocode for the ExternalSecureNoninvasiveDebugEnabled() function is as follows:

```c
// ExternalSecureNoninvasiveDebugEnabled()
// =======================================

boolean ExternalSecureNoninvasiveDebugEnabled()
{
    // In the recommended interface, ExternalSecureNoninvasiveDebugEnabled returns the state of the
    // (DBGEN OR NIDEN) AND (SPIDEN OR SPNIDEN) signal.
    if !HaveEL(EL3) && !IsSecure() then return FALSE;
    return ExternalNoninvasiveDebugEnabled() && (SPIDEN == HIGH || SPNIDEN == HIGH);
}
```
J2.4  Management registers and CoreSight compliance

The CoreSight architecture requires the implementation of a set of management registers that occupy the memory map from \(0xF00\) upwards in each of the debug components.

CoreSight compliance and complete implementation of the management registers is OPTIONAL, but ARM recommends that the registers are implemented.

The CoreSight architecture specification recommends that any integration test registers are implemented starting from \(0xEF\) downwards. Each of the debug components has an IMPLEMENTATION DEFINED region from \(0xE80\) to \(0xEF\) for this purpose.

J2.4.1  Coresight interface register map

Table J2-3 shows the external management register maps for the following registers:

- **ED**: These are the external debug register.
- **CTI**: These are the Cross-trigger interface registers.
- **PMU**: These are the Performance Monitors registers.

</table>
J2.4.2 Management register access permissions

Access to the OPTIONAL Integration Control register (ITCTRL) is IMPLEMENTATION DEFINED.

If the Debug power domain is off, all register accesses return an error.

Otherwise, Table J2-4 on page J2-5463, Table J2-5 on page J2-5464, and Table J2-6 on page J2-5465 show the response to accesses by the external debug interface to the CoreSight management registers. For definitions of the terms used in the tables, see External debug interface register access permissions summary on page H8-5110.

Note
Access to the CoreSight management registers is not affected by the values of EDAD and EPMAD.

Table J2-4 on page J2-5463, Table J2-5 on page J2-5464, and Table J2-6 on page J2-5465 include reserved management registers, because the CoreSight architecture requires that these registers are always RES0. The descriptions in Reserved and unallocated registers on page H8-5110 does not apply to reserved management registers if the implementation is CoreSight compliant.

If OPTIONAL memory-mapped access to the external debug interface is supported, there are additional constraints on memory-mapped accesses. See Register access permissions for memory-mapped accesses on page H8-5106.

The terms in Table J2-4 on page J2-5463, Table J2-5 on page J2-5464, and Table J2-6 on page J2-5465 are defined as follows:

**Domain**
This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.

**Conditions**
This lists the conditions under which the access is attempted.

To determine the access permissions for a register, read these columns from left to right, and stop at first column which lists the condition as being true.

The conditions are:

**Off**
EDPRSR.PU == 0. The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed.

Note
If debug power is off, then all external debug interface accesses return an error.

**DLK**
DoubleLockStatus() == TRUE. The OS Double Lock is locked, that is, EDPRSR.DLK == 1.
OSLK

OSLRS.QLK == 1. The OS Lock is locked.

Default

This provides the default access permissions, if there are no conditions that prevent access to the register.

SLK

This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See Register access permissions for memory-mapped accesses on page H8-5106. For all other accesses, this column is ignored.

The access permissions are:

-  This means that the default access permission applies. See the Default column, or the SLK column, if applicable.

RO

This means that the register or field is read-only.

RW

This means that the register or field is read/write. Individual fields within the register might be RO. See the relevant register description for details.

RC

This means that the bit clears to 0 after a read.

(SE)

This means that accesses to this register have indirect write side-effects. A side-effect occurs when a direct read or a direct write of a register creates an indirect write to the same register or to another register.

WO

This means that the register or field is write-only.

WI

This means that the register or field ignores writes.

IMP DEF

This means that the access permissions are IMPLEMENTATION DEFINED.

J2.4.3 Management register resets

Table J2-7 shows the management register resets. This table does not include:

- Read-only identification registers that have a fixed value from reset. These registers include those with the DEVAFFn, DEVARCH, DEVID[n], DEVTYPE, PIDRn, and CIDRn mnemonics.
- Registers that have the AUTHSTATUS mnemonic. This is a read-only status register that reflects the status outside of the reset domain of the register.
- Registers that have the LAR mnemonic. These are write-only registers that only have an effect on writes.

All other fields in the management registers are reset to an IMPLEMENTATION DEFINED value which can be UNKNOWN. The registers are in the reset domain specified in the table.

Table J2-7 shows a summary of the management register resets.

Appendix J3
Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events

This appendix describes the ARM recommendations for the use of the IMPLEMENTATION DEFINED event numbers. It contains the following sections:

- ARM recommendations for IMPLEMENTATION DEFINED event numbers on page J3-5468.
- Summary of events for exceptions taken to an Exception Level using AArch64 on page J3-5482.
J3.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers

These are the ARM recommendations for the use of the IMPLEMENTATION DEFINED event numbers. ARM does not define these events as rigorously as those in the architectural and microarchitectural event lists, and an implementation might:

• Modify the definition of an event to better correspond to the implementation.
• Not use some, or many, of these event numbers.
• Include cumulative occupancy for resource queues such as data access queues, and entry/exit counts, so that average latencies can be determined and counts for key resources that might exist can be separated.
• Provide registers in the IMPLEMENTATION DEFINED space to further extend such counts by, for example, specifying a minimum latency for an event to be counted.
• Use cumulative occupancy for resource queues, such as data access queues, and entry/exit counts, so that average latencies can be determined, separating out counts for key resources that might exist.

An implementation might also provide registers in the IMPLEMENTATION DEFINED space to further extend such counts, by, for example specifying a minimum latency for an event to be counted.

Table J3-1 lists the PMU IMPLEMENTATION DEFINED event numbers in event number order.

<tr>
<td>0x0A7</td>
<td>L3D_CACHE_WB_CLEAN</td>
<td>Level 3 data or unified cache write-back, cache clean</td>
</tr>
<tr>
<td>0x0A8</td>
<td>L3D_CACHE_INV</td>
<td>Level 3 data or unified cache access, invalidate</td>
</tr>
</tbody>
</table>

---

**Note**

For more information, see *Relationship between REFILL events and associated access events* on page J3-5481.

---

#### 0x040, Level 1 data cache access, read

This event is similar to Level 1 data cache access but the counter counts only memory-read operations that access at least the Level 1 data or unified cache.

#### 0x041, Level 1 data cache access, write

This event is similar to Level 1 data cache access but the counter counts only memory-write operations that access at least the Level 1 data or unified cache.

The counter counts DC ZVA as a store instruction.

#### 0x042, Level 1 data cache refill, read

This event is similar to Level 1 data cache refill but the counter counts only memory-read operations that cause a refill of at least the Level 1 data or unified cache.

See also *Relationship between REFILL events and associated access events* on page J3-5480.

#### 0x043, Level 1 data cache refill, write

This event is similar to Level 1 data cache refill but the counter counts only memory-write operations that cause a refill of at least the Level 1 data or unified cache.

The counter counts DC ZVA as a store instruction.

See also *Relationship between REFILL events and associated access events* on page J3-5480.

#### 0x044, Level 1 data cache refill, inner

This event is similar to Level 1 data cache refill but the counter counts only memory-read and memory-write operations that generate refills satisfied by transfer from another cache inside of the immediate cluster.

---

**Note**

The boundary between *inner* and *outer* is IMPLEMENTATION DEFINED, and it is not necessarily linked to other similar boundaries, such as the boundary between Inner Cacheable and Outer Cacheable or the boundary between Inner Shareable and Outer Shareable.

---

#### 0x045, Level 1 data cache refill, outer

This event is similar to Level 1 data cache refill but the counter counts only memory-read and memory-write operations that generate refills satisfied from outside of the immediate cluster.

#### 0x046, Level 1 data cache write-back, victim

This event is similar to Level 1 data cache write-back but the counter counts only write-backs that are a result of the line being allocated for an access made by the PE.

CP15 cache maintenance operations do not count as events.

It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache is counted. For example, this might occur if the PE detects streaming writes to memory and does not allocate lines to the cache, or as the result of a DC ZVA.
0x047, **Level 1 data cache write-back, cleaning and coherency**

This event is similar to Level 1 data cache write-back but the counter counts only write-backs that are a result of a coherency operation made by another PE or from a CP15 cache maintenance operation. Whether write-backs made as a result of CP15 cache maintenance operations are counted is IMPLEMENTATION DEFINED.

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

--- Note ---

The transfer of a dirty cache line from the Level 1 data cache of this PE to the Level 1 data cache of another PE due to a hardware coherency operation is not counted unless the dirty cache line is also written back to a Level 2 cache or memory.

0x048, **Level 1 data cache invalidate**

The counter counts each invalidation of a cache line in the Level 1 data or unified cache. The counter does not count events:

- If a cache refill invalidates a line.
- For locally executed CP15 cache set/way maintenance operations.

0x04C, **Level 1 data TLB refill, read**

This event is similar to Level 1 data TLB refill but the counter counts only memory-read operations that cause a data TLB refill of a least the Level 1 data or unified TLB.

See also *Relationship between REFILL events and associated access events* on page J3-5480.

0x04D, **Level 1 data TLB refill, write**

This event is similar to Level 1 data TLB refill but the counter counts only memory-write operations that cause a data TLB refill of a least the Level 1 data or unified TLB.

The counter counts DC ZVA as a store instruction. See also *Relationship between REFILL events and associated access events* on page J3-5480.

0x04E, **Level 1 data or unified TLB access, read**

This event is similar to Level 1 data or unified TLB access, but the counter counts only memory-read operations that cause a TLB access to at least the Level 1 data or unified TLB.

0x04F, **Level 1 data or unified TLB access, write**

This event is similar to Level 1 data or unified TLB access, but the counter counts only memory-write operations that cause a TLB access to at least the Level 1 data or unified TLB.

0x050, **Level 2 data cache access, read**

This event is similar to Level 2 data cache access but the counter counts only memory-read operations that access at least the Level 2 data or unified cache.

0x051, **Level 2 data cache access, write**

This event is similar to Level 2 data cache access but the counter counts only memory-write operations that access at least the Level 2 data or unified cache.

The counter counts DC ZVA as a store instruction.

0x052, **Level 2 data cache refill, read**

This event is similar to Level 2 data cache refill but the counter counts only memory-read operations that cause a refill of at least the Level 2 data or unified cache.

See also *Relationship between REFILL events and associated access events* on page J3-5480.
0x053, **Level 2 data cache refill, write**

This event is similar to Level 2 data cache refill but the counter counts only memory-write operations that cause a refill of at least the Level 2 data or unified cache.

The counter counts DC ZVA as a store instruction.

See also *Relationship between REFILL events and associated access events.* on page J3-5480.

0x056, **Level 2 data cache write-back, victim**

This event is similar to Level 2 data cache write-back but the counter counts only write-backs that are a result of the line being allocated for an access made by the PE.

CP15 cache maintenance operations do not count as events.

It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache is counted. For example, this might occur if the PE detects streaming writes to memory and does not allocate lines to the cache, or as the result of a DC ZVA.

0x057, **Level 2 data cache write-back, cleaning and coherency**

This event is similar to Level 2 data cache write-back but the counter counts only write-backs that are a result of a coherency operation made by another PE or CP15 cache maintenance operation. Whether write-backs made as a result of CP15 cache maintenance operations are counted is IMPLEMENTATION DEFINED.

--- Note ---

The transfer of a dirty cache line from the Level 2 data cache of this PE to the Level 2 data cache of another PE due to a hardware coherency operation is not counted unless the dirty cache line is also written back to a Level 3 cache or memory.

---

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

0x058, **Level 2 data cache invalidate**

The counter counts each invalidation of a cache line in the Level 2 data or unified cache.

The counter does not count events:

- If a cache refill invalidates a line.
- For locally executed CP15 set/way cache maintenance operations.

--- Note ---

Software that uses this event must know whether the Level 2 data cache is shared with other PEs. This event does not follow the general rule of Level 2 data cache events of only counting Attributable events.

---

0x05C, **Level 2 data or unified TLB refill, read**

This event is similar to Attributable Level 2 data or unified TLB refill, but the counter counts only Attributable memory read operations that cause a TLB refill of at least the Level 2 data or unified TLB. See also *Relationship between REFILL events and associated access events.* on page J3-5480.

0x05D, **Level 2 data or unified TLB refill, write**

This event is similar to Attributable Level 2 data or unified TLB refill, but the counter counts only Attributable memory write operations that cause a TLB refill of at least the Level 2 data or unified TLB. See also *Relationship between REFILL events and associated access events.* on page J3-5480.

0x05E, **Level 2 data or unified TLB access, read**

This event is similar to Attributable Level 2 data or unified TLB access, but the counter counts only the Attributable memory read operations that cause a TLB access to at least the Level 2 data or unified TLB.
**Appendix J3 Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events**

**J3.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers**

**0x05f, Level 2 data or unified TLB access, write**
This event is similar to Attributable Level 2 data or unified TLB access, but the counter counts only the Attributable memory write operations that cause a TLB access to at least the Level 2 data or unified TLB.

**0x060, Bus access, read**
This event is similar to bus access but the counter counts only memory-read operations that access outside the boundary of the PE and its closely-coupled caches.

**0x061, Bus access, write**
This event is similar to bus access but the counter counts only memory-write operations that access outside the boundary of the PE and its closely-coupled caches.

**0x062, Bus access, Normal, Cacheable, Shareable**
This event is similar to bus access but the counter counts only memory-read and memory-write operations that make Normal, Cacheable, Shareable accesses outside the boundary of the PE and its closely-coupled caches.

--- **Note** ---
It is IMPLEMENTATION DEFINED how the PE translates the attributes from the translation table entry for a region to the attributes on the bus.

In particular, a region of memory designated as Normal, Cacheable, Inner Shareable, Not Outer Shareable by a translation table entry, might be marked as either shareable or Non-shareable at the boundary of the PE and its closely-coupled caches. This depends on where the IMPLEMENTATION DEFINED boundary lies, between Inner and Outer Shareable.

If the Inner Shareable extends beyond the PE boundary, and the bus indicates the distinction between Inner and Outer Shareable, then either is counted as Shareable for the purposes of defining this event.

**0x063, Bus access, not Normal, Cacheable, Shareable**
This event is similar to bus access but the counter counts only memory-read and memory-write operations that make accesses outside the boundary of the PE and its closely-coupled caches that are not Normal, Cacheable, Shareable. For example, the counter counts accesses marked as:
- Normal, Cacheable, Non-shareable.
- Normal, Non-cacheable.
- Device.

--- **Note** ---
It is IMPLEMENTATION DEFINED how the PE translates the attributes from the translation table entries for a region to the attributes on the bus.

In particular, a region of memory designated as Normal, Cacheable, Inner Shareable, Not Outer Shareable by a translation table entry, might be marked as either shareable or Non-shareable at the boundary of the PE and its closely-coupled caches. This depends on where the IMPLEMENTATION DEFINED boundary lies, between Inner and Outer Shareable.

If the Inner Shareable extends beyond the PE boundary, and the bus indicates the distinction between Inner and Outer Shareable, then either is counted as Shareable for the purposes of defining this event.

**0x064, Bus access, normal**
This event is similar to bus access but the counter counts only memory-read and memory-write operations that make Normal accesses outside the boundary of the PE and its closely-coupled caches. For example, the counter counts Normal, Cacheable and Normal, Non-cacheable accesses but does not count Device accesses.
0x065, **Bus access, peripheral**

This event is similar to bus access but the counter counts only memory-read and memory-write operations that make Device accesses outside the boundary of the PE and its closely-coupled caches.

0x066, **Data memory access, read**

This event is similar to data memory access but the counter counts only memory-read operations that the PE made.

0x067, **Data memory access, write**

This event is similar to data memory access but the counter counts only memory-write operations made by the PE.

0x068, **Unaligned access, read**

This event is similar to data memory access but the counter counts only unaligned memory-read operations that the PE made. It also counts unaligned accesses if they are subsequently transposed into multiple aligned accesses.

0x069, **Unaligned access, write**

This event is similar to data memory access but the counter counts only unaligned memory-read operations that the PE made. It also counts unaligned accesses if they are subsequently transposed into multiple aligned accesses.

0x06A, **Unaligned access**

This event is similar to data memory access but the counter counts only unaligned memory-read operations and unaligned memory-write operations that the PE made. It also counts unaligned accesses if they are subsequently transposed into multiple aligned accesses.

0x06C, **Exclusive operation speculatively executed, Load-Exclusive**

The counter counts Load-Exclusive instructions speculatively executed.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x06D, **Exclusive operation speculatively executed, Store-Exclusive pass**

The counter counts Store-Exclusive instructions speculatively executed that completed a write.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the exclusive operation speculatively executed, Load-Exclusive event.

0x06E, **Exclusive operation speculatively executed, Store-Exclusive fail**

The counter counts Store-Exclusive instructions speculatively executed that fail to complete a write.

It is within the IMPLEMENTATION DEFINED definition of speculatively executed whether this includes conditional instructions that fail the condition code check.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the exclusive operation speculatively executed, Load-Exclusive event.

0x06F, **Exclusive operation speculatively executed, Store-Exclusive**

The counter counts Store-Exclusive instructions speculatively executed.

The definition of speculatively executed is IMPLEMENTATION DEFINED but it must be the same as for the exclusive operation speculatively executed, Load-Exclusive event.

ARM recommends that this event is implemented if it is not possible to implement the exclusive operation speculatively executed, Store-Exclusive pass, and exclusive operation speculatively executed, Store-Exclusive fail, events with the same degree of speculation as the exclusive operation speculatively executed, Load-Exclusive event.

0x070, **Operation speculatively executed, load**

This event is similar to the operation speculatively executed but the counter counts only memory-reading instructions. Defined by the instruction architecturally executed, condition code check pass, load event, see Common event numbers on page D5-1868.
The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the operation speculatively executed event.

0x071, **Operation speculatively executed, store**

This event is similar to the operation speculatively executed but the counter counts only memory-writing instructions. Defined by the instruction architecturally executed, condition code check pass, store event, see *Common event numbers* on page D5-1868.

The counter counts DC ZVA as a store operation.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the operation speculatively executed event.

0x072, **Operation speculatively executed, load or store**

This event is similar to the operation speculatively executed but the counter counts only memory-reading instructions and memory-writing instructions. Defined by the instruction architecturally executed, condition code check pass, load and instruction architecturally executed, condition code check pass, store events, see *Common event numbers* on page D5-1868.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the operation speculatively executed event.

0x073, **Operation speculatively executed, integer data-processing**

This event is similar to the operation speculatively executed but counts only integer data-processing instructions. It counts the following operations that operate on the general-purpose registers:

- In AArch64 state, *Data processing - immediate* on page C3-151 and *Data processing - register* on page C3-156.
- In AArch32 state, *Data-processing instructions* on page F1-2482.

This includes MOV and M VN operations.

This event also counts the following miscellaneous instructions:

- In AArch32 state, *PSTATE and banked register access instructions* on page F1-2490, *Banked register access instructions* on page F1-2490, *Miscellaneous instructions* on page F1-2494, other than ISB and preloads, and *Coprocessor instructions* on page F1-2496, other than coprocessor load and store instructions.

If the preload instructions PRFM, PL D, PL D7, and PLI, do not count as memory-reading instructions then they must count as integer data-processing instructions.

If ISBs do not count as software change of the PC then they must count as integer data-processing instructions.

The definition of speculatively executed is IMPLEMENTATION DEFINED, but must be the same as for the operation speculatively executed event.

It is IMPLEMENTATION DEFINED whether the following instructions are counted as integer data-processing operations, SIMD operations, or floating-point operations, but ARM recommends that the instructions are all counted as integer data-processing operations:

- For AArch64 state, from the A64 floating-point convert to integer class, operations that move a value between a general-purpose register and a SIMD and floating-point register without type conversion:
  - FMOV (general).

- For AArch64 state, from the SIMD Move group, operations that move a values between a general-purpose register and an element or elements in a SIMD and floating-point register:
  - DUP (general).
  - SM OV.
  - UMOV.
  - INS (general).
• In AArch32 state:
  — VDUP (general-purpose register) and all VMOV instructions that transfer data between a
general-purpose register and a SIMD and floating-point register.
  — VMRS.
  — VMSR.

0x074, Operation speculatively executed, Advanced SIMD
This event is similar to the operation speculatively executed but the counter counts only Advanced
SIMD data-processing instructions, see:
• For AArch64 state, the SIMD operations listed in Data processing - SIMD and floating-point
  on page C3-163.
• For AArch32 state, Advanced SIMD data-processing instructions on page F1-2500.
This includes all operations that operate on the SIMD and floating-point registers, except those that
are counted as:
• Integer data-processing operations.
• Floating-point data-processing operations.
• Memory-reading operations.
• Memory-writing operations.
• Cryptographic operations other than PMULL, in AArch64 state.
• VMULL, in AArch32 state.
Advanced SIMD scalar operations are counted as Advanced SIMD operations, including those
which operate on floating-point values. In AArch64 state, PMULL, and in AArch32 state, VMULL are
counted as Advanced SIMD operations.
The definition of speculatively executed is IMPLEMENTATION DEFINED, but must be the same as for
the operation speculatively executed event.

0x075, Operation speculatively executed, floating-point
This event is similar to the operation speculatively executed but the counter counts only
floating-point data-processing instructions, see:
• In AArch64 state, the floating-point operations listed in Data processing - SIMD and
  floating-point on page C3-163.
• In AArch32 state, Floating-point data-processing instructions on page F1-2508.
This includes all operations that operate on the SIMD and floating-point registers as floating-point
values, except for SIMD scalar operations and those that are counted as one of:
• Integer data-processing.
• Memory-reading operations.
• Memory-writing operations.
The following instructions that take both an integer register and a floating-point register argument
and perform a type conversion (to/from integer or to/from fixed-point), are counted as floating-point
data-processing operations:
• In AArch64 state, FCVT{<mode>}, UCVTF, and SCVTF.
• In AArch32, VCVT<mode>(floating-point), VCVT, VCVTT, and VCVTB.
The definition of speculatively executed is IMPLEMENTATION DEFINED, but must be the same as for
the operation speculatively executed event.

0x076, Operation speculatively executed, software change of the PC
This event is similar to the operation speculatively executed but the counter counts only software
changes of the PC. Defined by the instruction architecturally executed, condition code check pass,
software change of the PC event, see Common event numbers on page D5-1868.
The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for
the operation speculatively executed event.
Appendix J3 Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events

J3.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers

See also PC_WRITE_RETIRED in Table D5-6 on page D5-1868.

0x077, **Operation speculatively executed, Cryptographic instruction**

This event is similar to the operation speculatively executed but the counter counts only
Cryptographic instructions, except PMULL and VMULL, see *The Cryptographic Extensions on
page C3-180.*

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for
the operation speculatively executed event.

0x078, **Branch speculatively executed, immediate branch**

The counter counts immediate branch instructions speculatively executed. Defined by the
instruction architecturally executed, immediate branch event, see Common event numbers on
page D5-1868.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

See also BR_IMMED_RETIRED in Table D5-6 on page D5-1868.

0x079, **Branch speculatively executed, procedure return**

The counter counts procedure return instructions speculatively executed. Defined by the instruction
architecturally executed, condition code check pass, procedure return event, see Common event
numbers on page D5-1868.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

See also BR_RETURN_RETIRED in Table D5-6 on page D5-1868.

0x07A, **Branch speculatively executed, indirect branch**

The counter counts indirect branch instructions speculatively executed. This includes software
change of the PC other than exception-generating instructions and immediate branch instructions.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x07C, **Barrier speculatively executed, ISB**

The counter counts instruction synchronization barrier instructions speculatively executed,
including CP15ISB.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x07D, **Barrier speculatively executed, DSB**

The counter counts data synchronization barrier instructions speculatively executed, including
CP15DSB.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x07E, **Barrier speculatively executed, DMB**

The counter counts data memory barrier instructions speculatively executed, including CP15DSB.
It does not include the implied barrier operations of load/store operations with release consistency
semantics.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x081, **Exception taken, other synchronous**

This event is similar to exception taken but the counter counts only synchronous exceptions that are
not counted by the other Exception taken events. This event counts only exceptions taken locally.

0x082, **Exception taken, Supervisor Call**

This event is similar to exception taken but the counter counts only Supervisor Call exceptions. This event counts only exceptions taken locally.

0x083, **Exception taken, Instruction Abort**

This event is similar to exception taken but the counter counts only Instruction Abort exceptions.
This event counts only exceptions taken locally.
Appendix J3 Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events

J3.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers

0x084, Exception taken, Data Abort or SError
This event is similar to exception taken but the counter counts only Data Abort or SError interrupt exceptions. The counter counts only exceptions taken locally.

0x086, Exception taken, IRQ
This event is similar to exception taken but the counter counts only IRQ exceptions. The counter counts only exceptions taken locally, including Virtual IRQ exceptions.

0x087, Exception taken, FIQ
This event is similar to exception taken but the counter counts only FIQ exceptions. The counter counts only exceptions taken locally, including Virtual FIQ exceptions.

0x088, Exception taken, Secure Monitor Call
This event is similar to exception taken but the counter counts only Secure Monitor Call exceptions. The counter does not increment on SMC instructions trapped as a Hyp Trap exception.

0x08A, Exception taken, Hypervisor Call
This event is similar to exception taken but the counter counts only Hypervisor Call exceptions. The counter counts for both Hypervisor Call exceptions taken locally in the hypervisor and those taken as an exception from Non-secure EL1.

0x08B, Exception taken, Instruction Abort not taken locally
This event is similar to exception taken but the counter counts only Instruction Abort exceptions not taken locally.

0x08C, Exception taken, Data Abort or SError not taken locally
This event is similar to exception taken but the counter counts only Data Abort or SError interrupt exceptions not taken locally.

0x08D, Exception taken, other traps not taken locally
This event is similar to exception taken but the counter counts only those traps that are not counted as:
- Exception taken, Hypervisor Call.
- Exception taken, Instruction Abort not taken locally.
- Exception taken, Data Abort or SError not taken locally.
- Exception taken, IRQ not taken locally.
- Exception taken, FIQ not taken locally.

0x08E, Exception taken, IRQ not taken locally
This event is similar to exception taken but the counter counts only IRQ exceptions not taken locally.

0x08F, Exception taken, FIQ not taken locally
This event is similar to exception taken but the counter counts only FIQ exceptions not taken locally.

0x090, Release consistency operation speculatively executed, Load-Acquire
The counter counts Load-Acquire operations that are speculatively executed. The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x091, Release consistency operation speculatively executed, Store-Release
The counter counts Store-Release operations that are speculatively executed. The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x0A0, Level 3 data or unified cache access, read
This event is similar to Attributable Level 3 data or unified cache access, but the counter counts only the attributable memory read operations that cause a cache access to at least the Level 3 data or unified cache.
0x0A1, Level 3 data or unified cache access, write
This event is similar to Attributable Level 3 data or unified cache access, but the counter counts only
the attributable memory write operations that cause a cache access to at least the Level 3 data or
unified cache.

0x0A2, Level 3 data or unified cache refill, read
This event is similar to Attributable Level 3 data or unified cache refill, but the counter counts only
the attributable memory read operations that cause a refill of at least the Level 3 data or unified
(cache from outside the Level 3cache. See also Relationship between REFILL events and associated
access events.

0x0A3, Level 3 data or unified cache refill, write
This event is similar to Attributable Level 3 data or unified cache refill, but the counter counts only
the attributable memory write operations that cause a refill of at least the Level 3 data or unified
(cache from outside the Level 3cache. See also Relationship between REFILL events and associated
access events.

0x0A6, Level 3 data or unified cache write-back, victim
This event is similar to Attributable Level 3 data cache write-back but the counter counts only
write-backs that are a result of the line being allocated for an access made by the PE.
CP15 cache maintenance operations do not count as events.
It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the
eviction of a line from the cache is counted. For example, this might occur if the PE detects
streaming writes to memory and does not allocate lines to the cache, or as the result of a DC ZVA.

0x0A7, Level 3 data or unified cache write-back, cache clean
This event is similar to Level 3 data cache write-back but the counter counts only write-backs that
are a result of a coherency operation made by another PE or CP15 cache maintenance operation.
Whether write-backs made as a result of CP15 cache maintenance operations are counted is
IMPLEMENTATION DEFINED.

Note
The transfer of a dirty cache line from the Level 3 data cache of this PE to the Level 3 data cache of
another PE due to a hardware coherency operation is not counted unless the dirty cache line is also
written back to a Level 3 cache or memory.

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable
event.

0x0A8, Level 3 data or unified cache access, invalidate
The counter counts each invalidation of a cache line in the Level 3 data or unified cache.
The counter does not count events:
• If a cache refill invalidates a line.
• For locally executed CP15 set/way cache maintenance operations.

Note
Software that uses this event must know whether the Level 3 data cache is shared with other PEs.
This event does not follow the general rule of Level 3 data cache events of only counting
Attributable events.

J3.1.1 Relationship between REFILL events and associated access events.
CACHE_REFILL and TLB_REFILL events count the refills for accesses that are counted by the corresponding
CACHE or TLB event. Table J3-2 on page J3-5481 shows this correspondence.
### Table J3-2 Relationship between REFILL events and associated access events

<td>0x08F, FIQ not taken locally</td>
</tr>
</tbody>
</table>

**Note**

In these definitions, an exception that is *taken locally* means an exception that is taken to the default Exception level, and is not routed to another Exception level. See *Exception levels on page D1-1490* for more information.
Appendix J4

Legacy Instruction Syntax for AArch32 Instruction Sets

This appendix describes the legacy instruction syntax in the ARM instruction sets, and their Unified Assembler Language (UAL) equivalents. It contains the following section:

- Legacy Instruction Syntax on page J4-5486.
J4.1 Legacy Instruction Syntax

Early versions of the ARM Architecture defined an assembly language for A32 (ARM) instructions, and a separate assembly language for T32 (Thumb) instructions. UAL is based on the A32 assembly language, with some changes to the instruction syntax. The appendix describes those changes. The pre-UAL mnemonics are compatible with UAL, and might be supported by an assembler.

The original T32 assembly language is not compatible with UAL, and is not described in the manual.

J4.1.1 Pre-UAL instruction syntax for the A32 base instructions

Table J4-1 lists the syntax for the A32 base instructions that have changed after UAL was introduced.

### J4.1.3  FCONST

The syntax of FCONST is

```
FCNST<dest>{<c>} <Fd>, #<imm8>
```

where:

- `<dest>` Specifies the destination data type. It must be one of:
  - `S` Single-precision floating-point.
  - `D` Double-precision floating-point.
This is an optional field. It specifies the condition under which the instruction is executed. See Conditional execution on page F2-2517 for the range of available conditions and their encoding. If $\langle c \rangle$ is omitted, it defaults to always (AL).

Specifies the destination register. It must be one of:

- $\langle Dd \rangle$ 64-bit name of the SIMD&FP destination register.
- $\langle Sd \rangle$ 32-bit name of the SMID&FP destination register.

Specifies the immediate value used to generate the floating-point constant.

$\text{FCONST}\{\langle c \rangle\} \langle Dd \rangle$, #\langle imm8\rangle maps to $\text{VMOV.F64} \langle Dd \rangle$, #\langle fpimm\rangle

$\text{FCONST}\{\langle c \rangle\} \langle Sd \rangle$, #\langle imm8\rangle maps to $\text{VMOV.F32} \langle Sd \rangle$, #\langle fpimm\rangle
Appendix J5
Example OS Save and Restore Sequences

This appendix provides possible OS Save and Restore sequences for a v8 Debug implementation. It contains the following sections:
• *Save Debug registers* on page J5-5494.
• *Restore Debug registers* on page J5-5496.
### J5.1 Save Debug registers

This section shows how to save the registers that are used by an external debugger.

; On entry, X0 points to a block to save the debug registers in.
; Returns the pointer beyond the block and corrupts X1-X3

```assembly
SaveDebugRegisters
    ; (1) Set OS lock.
    MOV     X2,#1                       ; Set the OS lock. In AArch64 state, the OS lock
    MSR     OSLAR_EL1,X2                ; is writable via OSLAR.
    ISB                                 ; Context synchronization operation

    ; (2) Walk through the registers, saving them
    MRS     X1,OSDTRRX_EL1              ; Read DTRRX
    MRS     X2,OSDTRTX_EL1              ; Read DTRTX
    STP     W1,W2,[X0],#8               ; Save { DTRRX, DTRTX }
    MRS     X1,OSECCR_EL1               ; Read ECCR
    MRS     X2,MDSCR_EL1                ; Read DSCR
    STP     W1,W2,[X0],#8               ; Save { ECCR, DSCR }
    [ AARCH32_SUPPORTED
    MRS     X1,DBGVCR32_EL2             ; Read DBGVCR
    MRS     X2,dbgclaimclr_EL1          ; Read CLAIM - note, have to read via CLAIMCLR
    STP     W1,W2,[X0],#8               ; Save { VCR, CLAIM }
    ]

    ;; Macros for saving off a "register pair"
    ;; $WB is W for watchpoint, B for breakpoint
    ;; $num is the pair's number
    ;; X0 contains a pointer for the value words
    ;; X1 contains a pointer for the control words
    ;; W2 contains the max index
    MACRO
    SaveRP $WB,$num, $exit
        MRS     X3,DBG$WB.VR$num._EL1       ; Read DBGxVRn
        STR     X3,[X0],#8                  ; Save { xVRn }
        MRS     X3,DBG$WB.CR$num._EL1       ; Read DBGxCRn
        STR     W3,[X0],#4                  ; Save { xCRn }.
        [ $num > 1 :LAND: $num < 15
        CMP     W1,#$num
        BEQ     $exit
        ]
    MEND

    ; (3) Breakpoints
    MRS     X1,ID_AA64DFR0_EL1           ; Read DBGDIDR
    UBFX    W1,W1,#12,#4                ; Extract WRPs field
    MACRO
    SaveBRP $num                        ; Save a Breakpoint Register Pair
        SaveRP B,$num,SaveDebugRegisters_Watchpoints
    MEND
    SaveBRP 0
    SaveBRP 1
    SaveBRP 2
    ;; and so on to ...
    SaveBRP 15

Appendix J6
Recommended Upload and Download Processes for External Debug

• Using memory access mode in AArch64 state on page J6-5500.

     Note
     This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might find this information useful.
J6.1 Using memory access mode in AArch64 state

Figure J6-1 and Figure J6-2 on page J6-5501 show the processes for using memory access mode to implement a download (external host to target) and an upload (target to external host).

To transfer $n$ words of data:
- The download sequence needs $n+6$ accesses by the external debug interface.
- The upload sequence needs $n+8$ accesses by the external debug interface.

In both cases, in the innermost loop the debugger can make an external access to a DTR without polling EDSCR after each write as underrun and overrun detection prevent failure. Normally external accesses from the debugger are outpaced by the memory accesses of the PE, making underruns and overruns unlikely. If this is not the case, the EDSCR.ERR flag is set to 1. This is checked once at the end of the sequence, although a debugger can check it more often, for example once for each page. If the EDSCR.ERR flag is set to 1 because of overrun or underrun, the debugger can restart. The address to restart from is frozen in X0. EDSCR.ERR might also be set because of a Data abort.

If underruns and overruns are common, the debugger can pace itself accordingly.

---

**Note**

- The base address must be a multiple of 4.
- The order of the writes that set up the address does not matter in Debug state.

---

![Diagram](image-url)

**Figure J6-1 Fast code download in AArch64 (external host to target)**
In Figure J6-1 on page J6-5500, the sequence for the fast code download is as follows:

1. Setup. From the external debug interface:
   a. Write address [31:0] to DBGDTRRX_EL0.
   b. Write address [63:32] to DBGDTRTX_EL0.
   c. Write MRS X0, DBGDTR_EL0 to EDITR. The PE executes this instruction.
   d. Set EDSCR.MA to 1.

2. Loop $n$ times. From the external debug interface:
   a. Write to DBGDTRRX_EL0. The PE reads the word from DTRRX and stores it to memory. It increments X0 by 4.

3. Epilogue. From the external debug interface:
   a. Clear EDSCR.MA to 0.
   b. Read EDSCR to check for overruns or Data Aborts during download.

---

In Figure J6-2, the sequence for the fast code download is as follows:

1. Setup. From the external debug interface:
   a. Write address [31:0] to DBGDTRRX_EL0.
Appendix J6 Recommended Upload and Download Processes for External Debug
J6.1 Using memory access mode in AArch64 state

b. Write address [63:32] to DBGDTRTX_EL0.
c. Write MRS X0, DBGDTR_EL0 to EDITR.
d. Write MSR DBGDTR_EL0, X0 to EDITR. This dummy operation ensures EDSCR.TXfull == 1.
e. Set EDSCR.MA to 1.
f. Read DBGDTRTX_EL0 and discard the value. The PE returns the previous DTR value, loads the first word, and writes it to DTR. It increments X0 by 4.

2. Loop n-1 times. From the external debug interface:
a. Read DBGDTRTX_EL0. The PE returns the previous DTRTX value, loads a new word, and writes it to DTRTX. It increments X0 by 4.

3. Epilogue. From the external debug interface:
a. Clear EDSCR.MA to 0.
b. Read DBGDTRTX_EL0 for the nth value.
c. Read EDSCR to check for underruns, overruns or Data Aborts during upload.
Appendix J7
Barrier Litmus Tests

This appendix gives examples of the use of the barrier instructions provided by the ARMv8 architecture. It contains the following sections:

• Introduction on page J7-5504.
• Load-Acquire, Store-Release and barriers on page J7-5507.
• Load-Acquire Exclusive, Store-Release Exclusive and barriers on page J7-5514.
• Using a mailbox to send an interrupt on page J7-5519.
• Cache and TLB maintenance instructions and barriers on page J7-5520.
• ARMv7 compatible approaches for ordering, using DMB and DSB barriers on page J7-5531.

Note

This information is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.
J7.1 Introduction

The exact rules for the insertion of barriers into code sequences is a very complicated subject, and this appendix describes many of the corner cases and behaviors that are possible in an implementation of the ARMv8 architecture. This appendix is to help programmers, hardware design engineers, and validation engineers understand the need for the different kinds of barriers.

J7.1.1 Overview of memory consistency

Early generations of microprocessors were relatively simple processing engines that executed each instruction in program order. In such processors, the effective behavior was that each instruction was executed in its entirety before a subsequent instruction started to be executed. This behavior is sometimes referred to as the Sequential Execution Model (SEM), and in this Manual it is described as Simple sequential execution of the program.

In later processor generations, the need to increase processor performance, both in terms of the frequency of operation and the number of instructions executed each cycle, mean that such a simple form of execution is abandoned. Many techniques, such as pipelining, write buffering, caching, speculation, and out-of-order execution, are introduced to provide improved performance.

For general purpose PEs, such as ARM, these microarchitectural innovations are largely hidden from the programmer by a number of microarchitectural techniques. These techniques ensure that, within an individual PE, the behavior of the PE largely remains the same as the SEM. There are some exceptions to this where explicit synchronization is required. In the ARM architecture, these are limited to cases such as:

- Synchronization of changes to the instruction stream.
- Synchronization of changes to system control registers.

In both these cases, the ISB instruction provides the necessary synchronization.

While the effect of ordering is largely hidden from the programmer within a single PE, the microarchitectural innovations have a profound impact on the ordering of memory accesses. Write buffering, speculation, and cache coherency protocols, in particular, can all mean that the order in which memory accesses occur, as seen by an external observer, differs significantly from the order of accesses that would appear in the SEM. This is usually invisible in a uniprocessor environment, but the effect becomes much more significant when multiple PEs are trying to communicate with memory. In reality, these effects are often only significant at particular synchronization boundaries between the different threads of execution.

The problems that arise from memory ordering considerations are sometimes described as the problem of memory consistency. Processor architectures have adopted one or more memory consistency models, or memory models, that describe the permitted limits of the memory re-ordering that can be performed by an implementation of the architecture. The comparison and categorization of these has generated significant research and comment in academic circles, and ARM recommends the Memory Consistency Models for Shared Memory-Multiprocessors paper as an excellent detailed treatment of this subject.

This appendix does not reproduce such a work, but instead concentrates on some cases that demonstrate the features of the weakly-ordered memory model of the ARM architecture from ARMv6. In particular, the examples show how the use of the DMB and DSB memory barrier instructions can provide the necessary safeguards to limit memory ordering effects at the required synchronization points.

Appendix J7 Barrier Litmus Tests
J7.1 Introduction

Program order
The order of instructions as they appear in an assembly language program. This appendix does not attempt to describe or define the legal transformations from a program written in a higher level programming language, such as C or C++, into the machine language that can then be disassembled to give an equivalent assembly language program. Such transformations are a function of the semantics of the higher level language and the capabilities and options on the compiler.

J7.1.3 Conventions
Many of the examples are written in a stylized extension to ARM assembler, to avoid confusing the examples with unnecessary code sequences.

AArch32
The construct `WAIT([Rx]==1)` describes the following sequence:

```
loop
  LDR R12, [Rx]
  CMP R12, #1
  BNE loop
```

Also, the construct `WAIT_ACQ([Rx]==1)` describes the following sequence:

```
loop
  LDA R12, [Rx] ; load acquire ensures it is ordered before subsequent loads/stores
  CMP R12, #1
  BNE loop
```

R12 is chosen as an arbitrary temporary register that is not in use. It is named to permit the generation of a false dependency to ensure ordering.

AArch64
The construct `WAIT([Xx]==1)` describes the following sequence:

```
loop
  LDR W12, [Xx]
  CMP W12, #1
  B.NE loop
```

Also, the construct `WAIT_ACQ([Xx]==1)` describes the following sequence:

```
loop
  LDAR W12, [Xx] ; load acquire ensures it is ordered before subsequent loads/stores
  CMP W12, #1
  B.NE loop
```

R12 is chosen as an arbitrary temporary register that is not in use. It is named to permit the generation of a false dependency to ensure ordering.

For each example, a code sequence is preceded by an identifier of the observer running it:

- P0, P1…Px refer to caching coherent PEs that implement the ARMv8 architecture, and are in the same shareability domain.
- E0, E1…Ex refer to non-caching observers, that do not participate in the coherency protocol, but execute ARM instructions and have a weakly-ordered memory model. This does not preclude these observers being different objects, such as DMA engines or other system masters.

These observers are unsynchronized other than as required by the documented code sequence.

Note
Throughout this appendix, *ARM instruction* and *instruction* refer to instructions from the A64, A32, or T32 instruction set, provided by ARMv8 implementations.
Results are expressed in terms of `<agent>:<register>`, such as P0:R5. The results can be described as:

**Permissible**
This does not imply that the results expressed are required or are the only possible results. In most cases they are results that would not be possible under a sequentially consistent running of the code sequences on the agents involved. In general terms, this means that these results might be unexpected to anyone unfamiliar with memory consistency issues.

**Not permissible**
Results that the architecture expressly forbids.

**Required**
Results that the architecture expressly requires.

The examples omit the required shareability domain arguments of `DMB` and `DSB` instructions. The arguments are assumed to be selected appropriately for the shareability domains of the observers.

In AArch32 state, where the barrier function in the litmus test can be achieved by a `DMB ST`, that is a barrier to stores only, this is shown by the use of `DMB [ST]`. This indicates that the ST qualifier can be omitted without affecting the result of the test. In some implementations `DMB ST` is faster than `DMB`.

For AArch64 code, the shareability domain of the `DMB` or `DSB` must be included. This is shown in this manual using the notation `DMB <domain>` and `DSB <domain>` respectively.

Except where otherwise stated, other conventions are:

- All memory initializes to 0.
- R0 and W0 contain the value 1.
- R1 - R4 and W1 - W4 contain arbitrary independent addresses that initialize to the same value on all PEs. The addresses held in these registers are Shareable and:
  - The addresses held in R1 and R2 are in Write-Back Cacheable Normal memory.
  - The address held in R3 is in Write-Through Cacheable Normal memory.
  - The address held in R4 is in Non-cacheable Normal memory.
- R5 - R8 and W5 - W8 contain:
  - When used with an `STR` instruction, 0x55, 0x66, 0x77, and 0x88 respectively.
  - When used with an `LDR` instruction, the value 0.
- R11 and W11 contain a new instruction or new translation table entry, as appropriate, and R10 contains the virtual address and the ASID, for use in this change of translation table entry.
- Memory locations are Normal memory locations unless otherwise stated.

The examples use mnemonics for the cache maintenance and TLB maintenance instructions. The following tables describe the mnemonics:

- *Cache maintenance instructions, functional group* on page G4-4239.
- *TLB maintenance instructions, functional group* on page G4-4240.
J7.2 Load-Acquire, Store-Release and barriers

The Load-Acquire and Store-Release instructions are described in Load-Acquire, Store-Release on page B2-90.

The following sections show that most of the examples in sections Simple ordering and barrier cases on page J7-5531 and Load-Exclusive, Store-Exclusive and barriers on page J7-5537 can be achieved using the Load-Acquire and Store-Release instructions without the need for additional barriers.

J7.2.1 Message passing

The following sections describe:

• Resolving weakly-ordered message passing by using Acquire and Release.
• Resolving message passing by the use of Store-Release and address dependency on page J7-5508.

Resolving weakly-ordered message passing by using Acquire and Release

The message passing problem described in Weakly-ordered message passing problem on page J7-5531 can be solved by the use of Load-Acquire and Store-Release instructions when accessing the communications flag:

AArch32

P1

STR RS, [R1] ; sets new data
STL R0, [R2] ; sends flag indicating data ready, which is ordered after the STR

P2

WAIT_ACQ([R2]==1) ; waits on flag
LDR RS, [R1]

AArch64

P1

STR WS, [X1] ; sets new data
STLR W0, [X2] ; sends flag indicating data ready, which is ordered after the STR

P2

WAIT_ACQ([X2]==1) ; waits on flag
LDR WS, [X1]

This ensures the observed order of both the reads and the writes allows transfer of data such that the result P2:R5==0x55 is guaranteed.

This approach also works with multiple observers, in a way that further observers use the same sequence as P2 uses:

AArch32

P3

WAIT_ACQ([R2]==1) ; waits on flag
LDR RS, [R1]

AArch64

P3

WAIT_ACQ([X2]==1) ; waits on flag
LDR WS, [X1]
Resolving message passing by the use of Store-Release and address dependency

The lack of ordering of stores discussed in Message passing with multiple observers on page J7-5533 can be resolved by the use of Store-Release for the store of the valid flag by P1, even when the observers are using an address dependency:

**AArch32**

P1

```assembly
STR R5, [R1] ; sets new data
STL R0, [R2] ; sends flag indicating data ready using a Store-Release
```

P2

```assembly
WAIT([R2]==1)
AND R12, R12, #0 ; R12 is the destination of LDR in the WAIT macro
LDR R5, [R1, R12] ; the load has an address dependency on R12
: and so is ordered after the flag has been seen
```

**AArch64**

P1

```assembly
STR W5, [X1] ; sets new data
STLR W0, [X2] ; sends flag indicating data ready using a Store-Release
```

P2

```assembly
WAIT([X2]==1)
AND W12, W12, WZR ; W12 is the destination of LDR in the WAIT macro
LDR W5, [X1, X12] ; the load has an address dependency on W12
: and so is ordered after the flag has been seen
```

This ensures the observed order of the writes allows transfer of data such that P2:R5 and P3:R5 contain the same value of 0x55.

This approach also works with multiple observers, in a way that further observers use the same sequence as P2 uses:

**AArch32**

P3

```assembly
WAIT([R2]==1)
AND R12, R12, #0 ; R12 is the destination of LDR in the WAIT macro
LDR R5, [R1, R12] ; the load has an address dependency on R12
: and so is ordered after the flag has been seen
```

**AArch64**

P3

```assembly
WAIT([X2]==1)
AND W12, W12, WZR ; W12 is the destination of LDR in the WAIT macro
LDR W5, [X1, X12] ; the load has an address dependency on W12
: and so is ordered after the flag has been seen
```
J7.2.2 Address dependency with object construction

When accessing an object-oriented data structure, the address dependency rule means that barriers are not required, even when initializing the object. A Store-Release can be used to ensure the order of the update of the base address:

**AArch32**

P1

```asm
STR R5, [R1, #offset] ; sets new data in a field
STL R1, [R2] ; updates base address
```

P2

```asm
LDR R1, [R2] ; reads base address
CMP R1, #0 ; checks if it is valid
BEQ null_trap
LDR R5, [R1, #offset] ; uses base address to read field
```

**AArch64**

P1

```asm
STR W5, [X1, #offset] ; sets new data in a field
STLR X1, [X2] ; updates base address
```

P2

```asm
LDR X1, [X2] ; reads base address
CMP X1, #0 ; check if it is valid
B.EQ null_trap
LDR W5, [X1, #offset] ; uses base address to read field
```

It is required that P2:R5==0x55 if the null_trap is not taken. This avoids P2 observing a partially constructed object from P1. Significantly, P2 does not need a barrier to ensure this behavior.

The read of the base address in P2 could be a Load-Acquire, but it is not necessary in this case.

### J7.2.3 Causal consistency issues with multiple observers

The cause consistent problem discussed in *Causal consistency issues with multiple observers* can be addressed by the use of a Store-Release, as this requires that the store is multi-copy atomic in the case of a Load-Acquire. In addition, a Store-Release has an effect on the observation order of any stores observed by the observer executing the Store-Release.

The following sequences guarantee causal consistency:

- Using multi-copy atomicity of the Store-Release when observed by Load-Acquire.
- Using ordering property of Store-Release on stores observed by the PE on page J7-5510.

#### Using multi-copy atomicity of the Store-Release when observed by Load-Acquire

**AArch32**

P1

```asm
STL R0, [R2] ; sets new data
; this is made multi-copy atomic
```

P2

```asm
WAIT_ACQ((R2)==1) ; waits to see new data from P1
STR R0, [R3] ; sends flag
; must be after the new data has been by P2,
```
Appendix J7 Barrier Litmus Tests

J7.2 Load-Acquire, Store-Release and barriers

; as stores must not be speculative
; this does not need to be a Store-Release,
; though it could be a Store-Release

P3
WAIT([R3]=1) ; waits for P2 flag
; this does not need to be a WAIT_ACQ, although
; it could be a WAIT_ACQ (at which point the dependency is not needed)
AND R12, R12, #0 ; dependency to ensure order (only needed for a WAIT, not WAIT_ACQ)
ADD R12, R2, R12 ; creating a dependency
LDA R0, [R12] ; reads P1 data using a Load-Acquire

AArch64

P1
STLR W0, [X2] ; sets new data
; this is made multi-copy atomic

P2
WAIT_ACQ([X2]=1) ; waits to see new data from P1
STR W0, [X3] ; sends flag
; must be after the new data has been by P2 as stores
; must not be speculative.
; this does not need to be a Store-Release,
; though it could be a Store-Release

P3
WAIT([X3]=1) ; waits for P2 flag
; this does not need to be a WAIT_ACQ, though
; it could be a WAIT_ACQ (at which point the dependency is not needed)
AND W12, W12, WZR ; dependency to ensure order (only needed for a WAIT, not WAIT_ACQ)
ADD X12, X2, X12 ; creating a dependency
LDAR W0, [X12] ; reads P1 data using a Load-Acquire

In this case, P3:R0 == 0 is not permissible. P3 is guaranteed to see the store from P1 if P2 has seen the store from P1 using a Load-Acquire.

Using ordering property of Store-Release on stores observed by the PE

AArch32

P1
STR R0, [R2] ; sets new data
; this does not have to be a Store-Release, though it
; could be a Store-release

P2
WAIT ([R2]=1) ; waits to see new data from P1
STL R0, [R3] ; sends flag
; this must be after the new data has been seen by P2
; as stores must not be speculative,
; as a Store-Release, this orders the P1 store

P3
WAIT([R3]=1) ; waits for P2 flag
; this does not need to be a WAIT_ACQ, although it could be a WAIT_ACQ
; (at which point the dependency is not needed)
AND R12, R12, #0 ; dependency to ensure order (only needed for a WAIT, not WAIT_ACQ)
LDR R0, [R2, R12] ; reads P1 data
Appendix J7 Barrier Litmus Tests

J7.2 Load-Acquire, Store-Release and barriers

AArch64

P1

STR W0, [X2] ; sets new data
; this does not have to be a Store-Release, though it
; could be a Store-Release

P2

WAIT ([X2]==1) ; waits to see new data from P1
; this does not need to be a WAIT_ACQ, though it could be a WAIT_ACQ
STLR W0, [X3] ; sends flag
; this must be after the new data has been seen by P2
; as stores must not be speculative,
; as a Store-Release, this orders the P1 store

P3

WAIT([X3]==1) ; waits for P2 flag
; this does not need to be a WAIT_ACQ, though it could be a WAIT_ACQ
; at which point the dependency is not needed
AND W12, W12, WZR ; dependency to ensure order
; only needed for a WAIT, not WAIT_ACQ
LDR W0, [X2, X12] ; reads P1 data

In this case, P3:R0 == 0 is not permissible. P3 is guaranteed to see the store from P1 if P2 has seen the store from P1 before it does the Store-Release that is then seen by P3.

Note

The use of dependency by P3 could be replaced by a Load-Acquire.

J7.2.4 Multiple observers of writes to multiple locations

The ARM weakly consistent memory model means that different observers can observe writes to different locations in different orders as was shown in Multiple observers of writes to multiple locations on page J7-5534, but the use of Load-Acquire and Store-Release can resolve this. In this case, the loads by P3 and P4 must be Load-Acquire in order to ensure the perceived multi-copy atomicity of the stores:

AArch32

P1

STL R0, [R1] ; sets new data

P2

STL R0, [R2] ; sets new data

P3

LDA R10, [R2] ; reads P2 data before P1
LDA R9, [R1] ;
BIC R9, R10, R9 ; R9 <- R10 & ~R9
; R9 contains 1 if read from [R2] is observed to be 1 and
; read from [R1] is observed to be 0

P4

LDA R9, [R1]
LDA R10, [R2]
BIC R9, R9, R10 ; R9 <- R9 & ~R10
; R9 contains 1 if read from [R2] is observed to be 0 and
; read from [R1] is observed to be 1
**AArch64**

P1

```
STLR W0, [X1] ; sets new data
```

P2

```
STLR W0, [X2] ; sets new data
```

P3

```
LDAR W10, [X2] ; reads P2 data before P1
LDAR W9, [X1] ;
BIC W9, W10, W9 ; W9 <- W10 & -W9
; W9 contains 1 if read from [X2] is observed to be 1 and
; read from [X1] is observed to be 0
```

P4

```
LDAR W9, [X1]
LDAR W10, [X2]
BIC W9, W9, W10 ; W9 <- W9 & -W10
; W9 contains 1 if read from [X2] is observed to be 0 and
; read from [X1] is observed to be 1
```

In this case, the result P3:R9==1 and P4:R9==1 is not permissible, as the stores from P1 and P2 are multi-copy atomic when read by Load-Acquire.

Therefore, if P3 gets R10==1, then we know that the P3 load of R9 can only be observed after we know that P4 has also observed the P2 store to [R2]. Similarly, if the P4 load of R9 returns 1, and the P3 load of R9 returns 0, then the P3 load must have occurred before the P4 load.

Therefore, if the P3 load of R10 returns 1 and the P3 load of R9 returns 0, then we know that if the P4 load of R9 returns 1, it must have happened after P4 has observed the P2 store to [R2], so the P4 load of R10 must return 1.

This shows that, of the 4 possible values for \{P3:R9, P4:R9\}, the use of these instructions makes the result \{1,1\} impossible.
### J7.2.5 WFE and WFI and barriers

The Wait For Event and Wait For Interrupt instructions permit the PE to suspend execution and enter a low-power state. An explicit `DSB` barrier instruction is required if it is necessary to ensure memory accesses made before the `WFI` or `WFE` are visible to other observers, unless some other mechanism has ensured this visibility. Examples of other mechanism that would guarantee the required visibility are the `DMB` described in *Posting a store before polling for acknowledgement on page J7-5536*, or a dependency on a load.

The following example requires the `DSB` to ensure that the store is visible:

**AArch32**

```
P1
    STR R0, [R2]
    DSB
Loop
    WFI
    B Loop
```

**AArch64**

```
P1
    STR W0, [X2]
    DSB <domain>
Loop
    WFI
    B Loop
```

This requirement is unchanged in ARMv8 by the presence of Load-Acquire or Store-Release.
J7.3 Load-Acquire Exclusive, Store-Release Exclusive and barriers

The ARMv8 architecture adds the acquire and release semantics to Load-Exclusive and Store-Exclusive instructions, which allows them to gain ordering acquire and/or release semantics.

The Load-Exclusive instruction can be specified to have acquire semantics, and the Store-Exclusive instruction can be specified to have release semantics. These can be arbitrarily combined to allow the atomic update created by a successful Load-Exclusive and Store-Exclusive pair to have any of:

- No Ordering semantics (using LDREX and STREX).
- Acquire only semantics (using LDAEX and STREX).
- Release only semantics (using LDREX and STLEX).
- Sequentially consistent semantics (using LDAEX and STLEX).

In addition, the ARMv8 specification requires that the clearing of a global monitor will generate an event for the PE associated with the global monitor, which can simplify the use of WFE, by removing the need for a DSB barrier and SEV instruction.

J7.3.1 Acquiring a lock

A common use of Load-Exclusive and Store-Exclusive instructions is to claim a lock to permit entry into a critical region. This is typically performed by testing a lock variable that indicates 0 for a free lock and some other value, commonly 1 or an identifier of the process holding the lock, for a taken lock.

For a critical region, the requirement on taking a lock is usually for acquire semantics, while the clearing of a lock requires release semantics:

**AArch32**

```
Px
PLDW[R1] ; preload into cache in unique state
Loop
LDAEX R5, [R1] ; read lock with acquire
CMP R5, #0 ; check if 0
STRESEQ R5, R0, [R1] ; attempt to store new value
CMPSEQ R5, #0 ; test if store succeeded
BNE Loop ; retry if not
```

; loads and stores in the critical region can now be performed

**AArch64**

```
Px
PRFM PSTL1KEEP, [X1] ; preload into cache in unique state
Loop
LDAXR W5, [X1] ; read lock with acquire
CBNZ W5, Loop ; check if 0
STXR W5, W0, [X1] ; attempt to store new value
CBNZ W5, Loop ; test if store succeeded and retry if not
```

; loads and stores in the critical region can now be performed

The acquire associated with the load is sufficient to ensure the required ordering in a lock situation. The Store-Exclusive will fail (and so be retried) if there is a store to the location being monitored between the Load-Exclusive and the Store-Exclusive.
J7.3.2 Releasing a lock

The converse operation of releasing a lock does not require the use of Load-Exclusive and Store-Exclusive instructions, because only a single observer is able to write to the lock. However, often it is necessary for any observer to observe any memory updates, or any values that are loaded into memory, before they observe the release of the lock. Therefore, the lock release needs release semantics:

**AArch32**

```
Px

; loads and stores in the critical region
MOV R0, #0
STL R0, [R1] ; clear the lock with release semantics
```

**AArch64**

```
Px

; loads and stores in the critical region
STLR WZR, [X1] ; clear the lock with release semantics
```

J7.3.3 Ticket locks

When a lock is free, in order to avoid a rush to get the lock by many PEs, the use of ticket locks is common in more advanced systems. When the use is requested, the ticket locks determine the order of the users of the critical sections, in order to avoid starvation based on simple contention based spin lock.

A ticket lock allocates each thread a ticket number when it first requests the lock, and then compares that number with the current number for the lock. If they are the same, then the critical section can be entered. Otherwise the thread waits until the current number is equal to the ticket number for that thread.

The reading of the current number of the lock needs acquire semantics for the lock to be acquired.

--- Note ---

The code in this section is little-endian code, as it views the combined current and next values as a single combined quantity. The addresses of the current and next ticket values need to be adjusted for a big-endian system.

This is shown in the implementation below:

**AArch32**

```
Px

; R1 holds two 16 bit quantities
; the lower halfword holds the current ticket number
; the higher halfword holds the next ticket number

PLDW[R1] ; preload into cache in unique state

Loop1
LDAEX R5, [R1] ; read current and next
ADD R5, R5, #0x10000 ; increment the next number
STREX R6, R5, [R1] ; and update the value
CMP R6, #0 ; did the exclusive pass
BNE Loop1 ; retry if not
CMP R5, R5, ROR #16 ; is the current ticket ours
BEQ block_start

Loop2
LDAH R6, [R1] ; read current value
CMP R6, R5, LSR #16 ; compare it with our allocated ticket
BNE Loop2 ; retry (spin) if it is not the same

block_start
```
Appendix J7 Barrier Litmus Tests

J7.3 Load-Acquire Exclusive, Store-Release Exclusive and barriers

AArch64

Px

; X1 holds 2 16 bit quantities
; the lower halfword holds the current ticket number
; the higher halfword holds the next ticket number

PRFM PSTL1KEEP, [X1] ; preload into cache in unique state
Loop1
LDAXR W5, [X1] ; read current and next
ADD W5, W5, #0x10000 ; increment the next number
STXR W6, W5, [X1] ; and update the value
CBNZ W6, Loop1 ; did the exclusive pass - retry if not

AND W6, W5, #0xFFFF
CMP W6, W5, LSR #16 ; is the current ticket ours
B.EQ block_start

Loop2
LDARH W6, [X1] ; read current value
CMP W6, W5, LSR #16 ; compare it with the our allocated ticket
B.NE Loop2 ; retry (spin) if it isn't the same

block_start

Releasing the ticket lock simply involves incrementing the current ticket number, that is still assumed to be in R3, and doing a Store-Release:

AArch32

ADD R6, R6, #1
STLH R6, [R1]

AArch64

ADD W6, W6, #1
STLRH W6, [X1]

J7.3.4 Use of Wait For Event (WFE) and Send Event (SEV) with locks

The ARMv8 architecture can use the Wait For Event mechanism to minimise the energy cost of polling variables by putting the PE into a low power state, suspending execution, until an asynchronous exception or an explicit event is seen by that PE. In ARMv8, the event can be generated as a result of clearing the global monitor, so removing the need for a DSB barrier or an explicit send event message.

This can be used with simple locks or with ticket locks.

Simple lock

The following is an example of lock acquire code using WFE:

AArch32

Px

; preload into cache in unique state
Loop
LDAXR RS, [R1] ; read lock with acquire
CMP RS, #0 ; check if 0
WFE ; sleep if the lock is held
STREXEQ RS, R0, [R1] ; attempt to store new value
CMPEQ RS, #0 ; test if store succeeded
BNE Loop ; retry if not

J7-5516 Copyright © 2013-2015 ARM Limited. All rights reserved. Non-Confidential - Beta
**AArch64**

Px

```
SEVL ; invalidates the WFE on the first loop iteration
PRFM PSTL1KEEP, [X1] ; allocate into cache in unique state

Loop

WFE
LDAXR W5, [X1] ; read lock with acquire
CBNZ W5, Loop ; check if 0
STXR W5, W0, [X1] ; attempt to store new value
CBNZ W5, Loop ; test if store succeeded and retry if not

; loads and stores in the critical region can now be performed
```

And the following is an example of lock release code:

**AArch32**

Px

```
; loads and stores in the critical region
MOV R0, #0
STL R0, [R1] ; clear the lock
```

**AArch64**

Px

```
; loads and stores in the critical region
STLR WZR, [X1] ; clear the lock
```

**Ticket lock**

In the Ticket lock case, the Load-Exclusive instruction can be used to move the monitor into the exclusive state for the express purpose of creating an event when the monitor changes state:

**AArch32**

Px

```
; R1 holds 2 16 bit quantities
; the lower halfword holds the current ticket number
; the higher halfword holds the next ticket number

PLDW[R1] ; preload into cache in unique state

Loop1

LDAEX R5, [R1] ; read current and next
ADD R5, R5, #0x10000 ; increment the next number
STREX R6, R5, [R1] ; and update the value
CMP R6, #0 ; did the exclusive pass
BNE Loop ; retry if not
CMP R5, R5, ROR #16 ; is the current ticket ours
BEQ block_start
SEVL

Loop2

WFE ; wait if there has not been a change to the count since last
; read
LDAEXH R6, [R1] ; check the current count
CMP R6, R5, LSR #16 ; check if it is equal
BNE Loop2

block_start
```
Appendix J7 Barrier Litmus Tests
J7.3 Load-Acquire Exclusive, Store-Release Exclusive and barriers

AArch64

Px

; X1 holds 2 16 bit quantities
; the lower halfword holds the current ticket number
; the higher halfword holds the next ticket number

PRFM PSTLKEEP, [X1] ; preload into cache in unique state
Loop1
  LDAXR W5, [X1] ; read current and next
  ADD W5, W5, #0x10000 ; increment the next number
  STXR W6, W5, [X1] ; and update the value
  CBNZ W6, Loop1 ; did the exclusive pass – retry if not
  AND W6, W5, 0xFFFF
  CMP W6, W5, LSR #16 ; is the current ticket ours
  B.EQ block_start
  SEVL
Loop2
  WFE
  LDAXRH W6, [X1] ; read current value
  CMP W6, W5, LSR #16 ; compare it with our allocated ticket
  B.NE Loop2 ; retry (spin) if it is not the same
block_start
J7.4 Using a mailbox to send an interrupt

In some message passing systems, it is common for one observer to update memory and then notify a second observer of the update by sending an interrupt, using a mailbox.

Although a memory access might be made to initiate the sending of the mailbox interrupt, a DSB instruction is required to ensure the completion of previous memory accesses.

Therefore, the following sequence is required to ensure that P2 observes the updated value:

**AArch32**

P1

```
STR R5, [R1]          ; message stored to shared memory location
DSB ST
STR R0, [R4]          ; R4 contains the address of a mailbox
```

P2

```
; interrupt service routine
LDR R5, [R1]
```

**AArch64**

P1

```
STR W5, [X1]          ; message stored to shared memory location
DSB ST
STR W0, [X4]          ; R4 contains the address of a mailbox
```

P2

```
; interrupt service routine
LDR W5, [X1]
```
J7.5 Cache and TLB maintenance instructions and barriers

The following sections describe the use of barriers with cache and TLB maintenance instructions:

- Data cache maintenance instructions.
- Instruction cache maintenance instructions on page J7-5524.
- TLB maintenance instructions and barriers on page J7-5527.

J7.5.1 Data cache maintenance instructions

The following sections describe the use of barriers with data cache maintenance instructions:

- Message passing to non-caching observers.
- Multiprocessing message passing to non-caching observers on page J7-5521.
- Invalidating DMA buffers, non-functional example on page J7-5522.
- Invalidating DMA buffers, functional example with single PE on page J7-5522.
- Invalidating DMA buffers, functional example with multiple coherent PEs on page J7-5523.

Message passing to non-caching observers

The ARMv8 architecture requires the use of DMB instructions to ensure the ordering of data cache maintenance instructions and their effects. The Load-Acquire and Store-Release instructions have no effect on cache maintenance instruction. This means the following message passing approaches can be used when communicating between caching observers and non-caching observers:

**AArch32**

P1

```assembly
STR R5, [R1]          ; updates data (assumed to be in P1 cache)
DCCMVAC R1            ; cleans cache to point of coherency
DMB                   ; ensures effects of the clean will be observed before the
                      ; flag is set
STR R0, [R4]          ; sends flag to external agent (Non-cacheable location)
```

E1

```assembly
WAIT_ACQ ([R4] == 1) ; waits for the flag (with order)
LDR R5, [R1]          ; reads the data
```

**AArch64**

P1

```assembly
STR W5, [X1]          ; updates data (assumed to be in P1 cache)
DC CVAC, X1           ; cleans cache to point of coherency
DMB ISH               ; ensures effects of the clean will be observed before the
                      ; flag is set
STR W0, [X4]          ; sends flag to external agent (Non-cacheable location)
```

E1

```assembly
WAIT_ACQ ([X4] == 1) ; waits for the flag (with order)
LDR W5, [X1]          ; reads the data
```

In this example, it is required that E1:R5==0x55.
Multiprocessing message passing to non-caching observers

The broadcast nature of the cache maintenance instructions combined with properties of barriers, means that the message passing principle for non-caching observers is:

**AArch32**

**P1**

```
STR R5, [R1]          ; updates data (assumed to be in P1 cache)
STL R0, [R2]          ; sends a flag for P2 (ordered by the store release)
```

**P2**

```
WAIT ([R2] == 1)      ; waits for P1 flag
DMB                   ; ensures cache clean is observed after P1 flag is observed
DCCMVAC R1            ; cleans cache to point of coherency – will clean P1 cache
DMB                   ; ensures effects of the clean will be observed before the
                      ; flag to E1 is set
STR R0, [R4]          ; sends flag to E1
```

**E1**

```
WAIT ACQ ([R4] == 1)  ; waits for P2 flag (ordered)
LDR R5, [R1]          ; reads data
```

**AArch64**

**P1**

```
STR W5, [X1]          ; updates data (assumed to be in P1 cache)
STLR W0, [X2]         ; sends a flag for P2 (ordered)
```

**P2**

```
WAIT ([X2] == 1)      ; waits for P1 flag
DMB SY                ; ensures cache clean is observed after P1 flag is observed
DC CVAC, X1           ; cleans cache to point of coherency, will clean P1 cache
DMB SY                ; ensures effects of the clean will be observed before the
                      ; flag to E1 is set
STR W0, [X4]          ; sends flag to E1
```

**E1**

```
WAIT ACQ ([X4] == 1)  ; waits for P2 flag
LDR W5, [X1]          ; reads data
```

In this example, it is required that E1:R5==0x55. The clean operation executed by P2 affects the data location in the P1 cache. The cast-out from the P1 cache is guaranteed to be observed before P2 updates [R4].

**Note**

The cache maintenance instructions are not ordered by the Load-Acquire and Store-Release instructions.
Invalidating DMA buffers, non-functional example

The basic scheme for communicating with an external observer that is a process that passes data in to a Cacheable memory region must take account of the architectural requirement that regions marked as Cacheable can be allocated into a cache at any time, for example as a result of speculation. The following example shows this possibility:

**AArch32**

P1

```
DCIMVAC R1            ; ensures cache is not dirty. A clean operation could be used
; but as the DMA will subsequently overwrite this region an
; invalidate operation is sufficient and usually more efficient
DMB                   ; ensures cache invalidation is observed before the next store
; is observed
STR R0, [R3]          ; sends flag to external agent
WAIT_ACQ ([R4]==1)    ; waits for a different flag from an external agent
LDR R5, [R1]

E1

WAIT ([R3] == 1)      ; waits for flag
STR R5, [R1]          ; stores new data
STL R0, [R4]          ; sends a flag
```

**AArch64**

P1

```
DC IVAC, X1           ; ensure cache is not dirty. A clean operation could be used
; but as the DMA will subsequently overwrite this region an
; invalidate operation is sufficient and usually more efficient
DMB SY                ; ensures cache invalidation is observed before the next store
; is observed
STR W0, [X3]          ; sends flag to external agent
WAIT_ACQ ([X4]==1)    ; waits for a different flag from an external agent
LDR W5, [X1]

E1

WAIT ([X3] == 1)      ; waits for flag
STR W5, [X1]          ; stores new data
STLR W0, [X4]         ; sends a flag
```

If a speculative access occurs, there is no guarantee that the cache line containing [R1] is not brought back into the cache after the cache invalidation, but before [R1] is written by E1. Therefore, the result P1:R5=0 is permissible.

**Invalidating DMA buffers, functional example with single PE**

**AArch32**

P1

```
DCIMVAC R1            ; ensures cache is not dirty. A clean operation could be used
; but as the DMA will subsequently overwrite this region an
; invalidate operation is sufficient and usually more efficient
DMB                   ; ensures cache invalidation is observed before the next store
; is observed
STR R0, [R3]          ; sends flag to external agent
WAIT ([R4]==1)        ; waits for a different flag from an external agent
DCIMVAC R1            ; ensures cache discards stale copies before use
LDR R5, [R1]
```
Appendix J7 Barrier Litmus Tests

J7.5 Cache and TLB maintenance instructions and barriers

E1

```
WAIT ([R3] == 1) ; waits for flag
STR R5, [R1] ; stores new data
STL R0, [R4] ; sends a flag
```

AArch64

P1

```
DC IVAC, X1 ; ensures cache is not dirty. A clean operation could be used
; but as the DMA will subsequently overwrite this region an
; invalidate operation is sufficient and usually more efficient
DMB SY ; ensures cache invalidation is observed before the next store
; is observed
STR W0, [X3] ; sends flag to external agent
WAIT ([X4]==1) ; waits for a different flag from an external agent
DMB SY ; ensures that cache invalidate is observed after the flag
; from external agent is observed
DC IVAC, X1 ; ensures cache discards stale copies before use
LDR W5, [X1]
```

E1

```
WAIT ([X3] == 1) ; waits for flag
STR W5, [X1] ; stores new data
STLR W0, [X4] ; sends a flag
```

In this example, the result P1:R5 == 0x55 is required. Including a cache invalidation after the store by E1 to [R1] is observed ensures that the line is fetched from external memory after it has been updated.

Invalidating DMA buffers, functional example with multiple coherent PEs

The broadcasting of cache maintenance instructions, and the use of DMB instructions to ensure their observability, means that the previous example extends naturally to a multiprocessor system. Typically this requires a transfer of ownership of the region that the external observer is updating.

AArch32

P0

```
(Use data from [R1], potentially using [R1] as scratch space)
STL R0, [R2] ; signals release of [R1]
WAIT_ACQ ([R2] == 0) ; waits for new value from DMA
LDR R5, [R1]
```

P1

```
WAIT ([R2] == 1) ; waits for release of [R1] by P0
DCIMVAC R1 ; ensures caches are not dirty, an invalidate is sufficient
DMB
STR R0, [R3] ; requests new data for [R1]
WAIT ([R4] == 1) ; waits for new data
DMB
DCIMVAC R1 ; ensures caches discards stale copies before use
DMB
MOV R0, #0
STR R0, [R2] ; signals availability of new [R1]
```

E1

```
WAIT ([R3] == 1) ; waits for new data request
STR R5, [R1] ; sends new [R1]
DMB [ST]
STR R0, [R4] ; indicates that new data is available to P1
```
J7.5 Cache and TLB maintenance instructions and barriers

J7.5.2 Instruction cache maintenance instructions

The following sections describe the use of barriers with instruction cache maintenance instructions:

- **Ensuring the visibility of updates to instructions for a uniprocessor.**
- **Ensuring the visibility of updates to instructions for a multiprocessor** on page J7-5525.

### Ensuring the visibility of updates to instructions for a uniprocessor

On a single PE, the agent that causes instruction fetches, or instruction cache linefills, is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the instruction cache can rely only on seeing updates to memory that are complete. This must be ensured by the use of a **DSB** instruction.

Also, instruction cache maintenance instructions are only guaranteed to complete after the execution of a **DSB**, and an **ISB** is required to discard any instructions that might have been prefetched before the instruction cache invalidation completed. Therefore, on a uniprocessor, to ensure the visibility of an update to code and to branch to it, the following sequence is required:

#### AArch32

**P1**

```assembly
STR R11, [R1]  ; R11 contains a new instruction to be stored in program memory
DCCMVAU R1     ; clean to PoU makes the new instruction visible to the instruction cache
DSB
ICIMVAU R1     ; ensures instruction cache/branch predictor discards stale data
BPIMVA R1
DSB
ISB
BX R1
```

In AArch64, the branch predictor maintenance is not required.

#### AArch64

**P0**

```assembly
(Use data from [X1], potentially using [X1] as scratch space)
STLR W0, [X2]  ; signals release of [X1]
WAIT_ACQ ([X2] == 0)  ; waits for new value from DMA
LDR W5, [X1]

P1

WAIT ([X2] == 1)  ; waits for release of [R1] by P0
DC IVAC, X1  ; ensures caches are not dirty, an invalidate is sufficient
DMB SY
STR W0, [X3]  ; requests new data for [R1]
WAIT ([X4] == 1)  ; waits for new data
DMB SY
DCIMVAC X1  ; ensures caches discard stale copies before use
DMB SY
STR WZR, [X2]  ; signals availability of new [R1]

E1

WAIT ([X3] == 1)  ; waits for new data request
STR W5, [X1]  ; sends new [R1]
STR W0, [X4]  ; indicates new data is available to P1
```

In this example, the result P0:R5 == 0x55 is required. The **DMB** issued by P1 after the first data cache invalidation ensures that effect of the cache invalidation on P0 is seen by E1 before the store by E1 to [R1]. The **DMB** issued by P1 after the second data cache invalidation ensures that its effects are seen before the store of 0 to the semaphore location in [R2].
Appendix J7 Barrier Litmus Tests

J7.5 Cache and TLB maintenance instructions and barriers

Note

Where the changes to the instructions span multiple cache lines, then the data cache and instruction cache maintenance instructions can be duplicated to cover each of the lines to be cleaned and to be invalidated.

Ensuring the visibility of updates to instructions for a multiprocessor

The ARMv8 architecture requires a PE that executes an instruction cache maintenance instruction to execute a DSB instruction to ensure completion of the maintenance operation. This ensures that the cache maintenance instruction is complete on all PEs in the Inner Shareable shareability domain.

An ISB is not broadcast, and so does not affect other PEs. This means that any other PE must perform its own ISB synchronization after it knows that the update is visible, if it is necessary to ensure its synchronization with the update. The following example shows how this might be done:

**AArch32**

**P1**

```assembly
STR R11, [R1]  ; R11 contains a new instruction to be stored in program memory
DCCMVAU R1     ; clean to PoU makes the new instruction visible to the instruction cache
DSB            ; ensures completion of the clean on all PEs
ICIMVAU R1     ; ensures instruction cache discards stale data
BPIMVA R       ; ensures branch predictor discards stale data
DSB            ; ensures completion of the instruction cache and branch predictor invalidation on all PEs
STR R0, [R2]   ; sets flag to signal completion
ISB            ; synchronizes context on this PE
BX R1          ; branches to new code
```

**P2-Px**

```assembly
WAIT ([R2] == 1) ; waits for flag signalling completion
ISB             ; synchronizes context on this PE
BX R1           ; branches to new code
```

**AArch64**

**P1**

```assembly
STR X11, [X1]  ; X11 contains a new instruction to be stored in program memory
DC CVAU, X1    ; clean to PoU makes the new instruction visible to the instruction cache
DSB ISH        ; ensures completion of the clean on all PEs
IC IVAU, X1    ; ensures instruction cache/branch predictor discards stale data
DSB ISH        ; ensures completion of the instruction cache/branch predictor invalidation on all PEs
STR W0, [X2]   ; sets flag to signal completion
ISB            ; synchronizes context on this PE
BR X1          ; branches to new code
```

**P2-Px**

```assembly
WAIT ([X2] == 1) ; waits for flag signalling completion
ISB             ; synchronizes context on this PE
BR X1           ; branches to new code
```
Nonfunctional approach

The following sequence does not have the same effect, because a DSB is not required to complete the instruction cache maintenance instructions that other PEs issue:

**AArch32**

P1

STR R11, [R1] ; R11 contains a new instruction to be stored in program memory
DCCMV AU R1 ; clean to PoU makes the new instruction visible to the instruction cache
DSB ; ensures completion of the clean on all PEs
ICIMVAU R1 ; ensures instruction cache discards stale data
BPIMVA R1 ; ensures branch predictor discards stale data
DMB ; ensures ordering of the store after the invalidation
; DOES NOT guarantee completion of instruction cache/branch predictor on other PEs
STR R0, [R2] ; sets flag to signal completion
DSB ; ensures completion of the invalidation on all PEs
ISB ; synchronizes context on this PE
BX R1 ; branches to new code

P2-Px

WAIT ([R2] == 1) ; waits for flag signalling completion
DSB ; this DSB does not guarantee completion of P1
; ICIMVAU/BPIMVA
ISB
BX R1

**AArch64**

P1

STR W11, [X1] ; W11 contains a new instruction to be stored in program memory
DC CVAU, X1 ; clean to PoU makes the new instruction visible to instruction cache
DSB ISH ; ensures completion of the clean on all PEs
IC IVAU, X1 ; ensures instruction cache/branch predictor discards stale data
DMB ISH ; ensures ordering of the store after the invalidation
; DOES NOT guarantee completion of instruction cache/branch predictor on other PEs
STR W0, [X2] ; sets flag to signal completion
DSB ISH ; ensures completion of the invalidation on all PEs
ISB ; synchronizes context on this PE
BR X1 ; branches to new code

P2-Px

WAIT ([X2] == 1) ; waits for flag signalling completion
DSB ISH ; this DSB does not guarantee completion of P1
; ICIMVAU/BPIMVA
ISB
BR X1

In this example, P2...Px might not see the updated region of code at R1.
J7.5.3 TLB maintenance instructions and barriers

The following sections describe the use of barriers with TLB maintenance instructions:

- Ensuring the visibility of updates to translation tables for a uniprocessor.
- Ensuring the visibility of updates to translation tables for a multiprocessor on page J7-5528.
- Paging memory in and out on page J7-5528.

Ensuring the visibility of updates to translation tables for a uniprocessor

On a single PE, the agent that causes translation table walks is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the TLB can only rely on seeing updates to memory that are complete. This must be ensured by the use of a DSB instruction.

The ARMv8 architecture requires that translation table walks look in the data or unified caches at L1, so such systems do not require data cache cleaning.

After the translation tables update, any old copies of entries that might be held in the TLBs must be invalidated. This operation is only guaranteed to affect all instructions, including instruction fetches and data accesses, after the execution of a DSB and an ISB. Therefore, the code for updating a translation table entry is:

AArch32

```assembly
P1
    STR R11, [R1]          ; updates the translation table entry
    DSB                   ; ensures visibility of the update to translation table walks
    TLBIMVA R10
    BPIALL
    DSB                   ; ensures completion of the BP and TLB invalidation
    ISB                   ; synchronises context on this PE
    ; new translation table entry can be relied upon at this point and all accesses
    ; generated by this observer using
    ; the old mapping have been completed
```

AArch64

```assembly
P1
    STR X11, [X1]          ; updates the translation table entry
    DSB ISH               ; ensures visibility of the update to translation table walks
    TLBI VAE1, X10        ; assumes we are in the EL1
    DSB ISH               ; ensures completion of the TLB invalidation
    ISB                   ; synchronises context on this PE
    ; new translation table entry can be relied upon at this point and all accesses
    ; generated by this observer using
    ; the old mapping have been completed
```

Importantly, by the end of this sequence, all accesses that used the old translation table mappings have been observed by all observers.

An example of this is where a translation table entry is marked as invalid. Such a system must provide a mechanism to ensure that any access to a region of memory being marked as invalid has completed before any action is taken as a result of the region being marked as invalid.
Ensuring the visibility of updates to translation tables for a multiprocessor

The same code sequence can be used in a multiprocessing system. The ARMv8 architecture requires a PE that executes a TLB maintenance instruction to execute a DSB instruction to ensure completion of the maintenance operation. This ensures that the TLB maintenance instruction is complete on all PEs in the Inner Shareable shareability domain.

The completion of a DSB that completes a TLB maintenance instruction ensures that all accesses that used the old mapping have completed.

AArch32

P1

    STR R11, [R1]         ; updates the translation table entry
    DSB                   ; ensures visibility of the update to translation table walks
    TLBIMVAIS R10
    BPIALLIS
    DSB                   ; ensures completion of the BP and TLB invalidation
    ISB                   ; Note ISB is not broadcast and must be executed locally
    ; on other PEs
    ; new translation table entry can be relied upon at this point and all accesses
    ; generated by any observers affected by the broadcast TLBIMVAIS operation using
    ; the old mapping have been completed

AArch64

P1

    STR X11, [X1]         ; updates the translation table entry
    DSB ISH               ; ensures visibility of the update to translation table walks
    TLBI VAEIS, X10      ; ensures completion of the TLB invalidation
    DSB ISH               ; Note ISB is not broadcast and must be executed locally
    ISB                   ; on other PEs
    ; new translation table entry can be relied upon at this point and all accesses
    ; generated by any observers affected by the broadcast TLBIMVAIS operation using
    ; the old mapping have been completed

The completion of the TLB maintenance instruction is guaranteed only by the execution of a DSB by the observer that performed the TLB maintenance instruction. The execution of a DSB by a different observer does not have this effect, even if the DSB is known to be executed after the TLB maintenance instruction is observed by that different observer.

Paging memory in and out

In a multiprocessor system there is a requirement to ensure the visibility of translation table updates when paging regions of memory into RAM from a backing store. This might, or might not, also involve paging existing locations in memory from RAM to a backing store. In such situations, the operating system selects one or more pages of memory that might be in use but are suitable to discard, with or without copying to a backing store, depending on whether or not the region of memory is writable. Disabling the translation table mappings for a page, and ensuring the visibility of that update to the translation tables, prevents agents accessing the page.

For this reason, it is important that the DSB that is performed after the TLB invalidation ensures that no other updates to memory using those mappings are possible.

An example sequence for the paging out of an updated region of memory, and the subsequent paging in of memory, is as follows:

AArch32

P1

    STR R11, [R1]         ; updates the translation table for the region being paged out
    DSB                   ; ensures visibility of the update to translation table walks
    TLBIMVAIS R10
    DSB                   ; invalidates the old entry
    DSB                   ; ensures completion of the invalidation on all PEs
Appendix J7 Barrier Litmus Tests

J7.5 Cache and TLB maintenance instructions and barriers

ISB ; ensures visibility of the invalidation
BL SaveMemoryPageToBackingStore
BL LoadMemoryFromBackingStore
DSB ; ensures completion of the memory transfer (this could be part of
; LoadMemoryFromBackingStore
ICIALLUIS ; also invalidates the branch predictor
STR R9, [R1] ; creates a new translation table entry with a new mapping
DSB ; ensures completion of the instruction cache
; and branch predictor invalidation
; AND ensures visibility of the new translation table mapping
ISB ; ensures synchronisation of this instruction stream

AArch64

P1

STR X11, [X1] ; updates the translation table for the region being paged out
DSB ISH ; ensures visibility of the update to translation table walks
TLBI VAEIIS, X10 ; invalidates the old entry
DSB ISH ; ensures completion of the invalidation on all PEs
ISB ; ensures visibility of the invalidation
BL SaveMemoryPageToBackingStore
BL LoadMemoryFromBackingStore
DSB ISH ; ensures completion of the memory transfer (this could be part of
; LoadMemoryFromBackingStore
IC IALLUIS ; also invalidates the branch predictor
STR X9, [X1] ; creates a new translation table entry with a new mapping
DSB ISH ; ensures completion of the instruction cache
; and branch predictor invalidation
; AND ensures visibility of the new translation table mapping
ISB ; ensures synchronisation of this instruction stream

This example assumes the memory copies are performed by an observer that is coherent with the caches of PE P1. This observer might be P1 itself, using a specific paging mapping. For clarity, the example omits the functional descriptions of SaveMemoryPageToBackingStore and LoadMemoryFromBackingStore. LoadMemoryFromBackingStore is required to ensure that the memory updates that it makes are visible to instruction fetches.

In this example, the use of ICIALLUIS in AArch32 and IC IALLUIS in AArch64 to invalidate the entire instruction cache is a simplification, that might not be optimal for performance. An alternative approach involves invalidating all of the lines in the caches using ICIMV AU and IC IV AU operations in AArch32 and AArch64 respectively. This invalidation must be done when the mapping used for the ICIMV AU and IC IV AU operations is valid but not executable.

J7.5.4 Ordering of Memory-mapped device control with payloads

With a Memory-mapped peripheral, such as a DMA, which can also access memory for its own use, it is common to have control or status registers which are Memory-mapped. These registers need to be accessed in an ordered manner with respect to the data that the Memory-mapped peripheral is handling.

Two simple examples of this are:

• When a Processing Element is writing a buffer of data, and then writing to a control register in the DMA peripheral to start that peripheral to access the buffer of data.

• When a DMA peripheral has written to a buffer of data in memory, and the Processing Element is reading a status register to determine that the DMA transfer has completed, and then is reading the data.

For the case of the Processing Element writing a buffer of data, before starting the DMA peripheral, the ordering requirements between the stores to the data buffer and the stores to the Memory-mapped a to the DMA peripheral can be met by the insertion of a DSB <domain> instruction between these sets of accesses as this ensures the global observation of the stores before the DMA is started. this is shown by the following code:

AArch32

P1

STR R5, [R2] ; data written to the data buffer
DSB
STR R0, [R4]          ; R4 contains the address of the DMA control register

AArch64

P1
STR W5, [X2]          ; data written to the data buffer
DSB <domain>          ; X4 contains the address of the DMA control register
STR W0, [X4]

For the case of DMA peripheral writing the data buffer and then setting a status register when those stores are complete (and so globally observed) and then having this status register polled by the Processing element before the processing element reads the data buffer, the processing element must insert a DSB <domain> between the load that reads the status register, and the read of the buffer. A DMB, or load-acquire, is not sufficient as this problem is not solely concerned with observation order, since the polling read is actually a read of a status register at a slave, not the polling a data value that has been written by an observer.

For this case, the code is therefore:

AArch32

P1
WAIT ([R4] == 1)      ; R4 contains the address of the status register,
DSB ; and the value '1' indicates completion of the DMA transfer
LDR R5, [R2]          ; reads data from the data buffer

AArch64

P1
WAIT ([X4] == 1)      ; X4 contains the address of the status register,
DSB <domain> ; and the value '1' indicates completion of the DMA transfer
LDR W5, [X2]          ; reads data from the data buffer
J7.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

The following sections describe the ARMv7 compatible approaches for ordering, using DMB and DSB barriers:

- Simple ordering and barrier cases.
- Load-Exclusive, Store-Exclusive and barriers on page J7-5537.
- Using a mailbox to send an interrupt on page J7-5539.
- Cache and TLB maintenance instructions and barriers on page J7-5539.

J7.6.1 Simple ordering and barrier cases

ARM implements a weakly consistent memory model for Normal memory. In general terms, this means that the order of memory accesses observed by other observers might not be the order that appears in the program, for either loads or stores.

This section includes examples of this.

Simple weakly consistent ordering example

P1

```
STR R5, [R1]
LDR R6, [R2]
```

P2

```
STR R6, [R2]
LDR R5, [R1]
```

In the absence of barriers, the result of P1: R6=0, P2: R5=0 is permissible.

Message passing

The following sections describe:

- Weakly-ordered message passing problem.
- Message passing with multiple observers on page J7-5533.

Weakly-ordered message passing problem

P1

```
STR R5, [R1]             ; sets new data
STR R0, [R2]             ; sends flag indicating data ready
```

P2

```
WAIT([R2]==1)            ; waits on flag
LDR R5, [R1]             ; reads new data
```

In the absence of barriers, an end result of P2: R5=0 is permissible.

Resolving by the addition of barriers

The addition of barriers, to ensure the observed order of the reads and the writes, ensures that data is transferred so that the result P2: R5==0x55 is guaranteed, as follows:

P1

```
STR R5, [R1]             ; sets new data
DMB [ST]                 ; ensures all observers observe data before the flag
STR R0, [R2]             ; sends flag indicating data ready
```
Appendix J7 Barrier Litmus Tests

J7.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

P2

```
WAIT([R2]==1) ; waits on flag
DMB ; ensures that the load of data is after the flag has been observed
LDR R5, [R1]
```

Resolving by the use of barriers and address dependency

There is a rule within the ARM architecture that:

- Where the value returned by a read is used for computation of the virtual address of a subsequent read or write, then these two memory accesses are observed in program order.

Where the value returned by a read is used for computation of the virtual address of a subsequent read or write, this is called an *address dependency*. An address dependency exists even if the value returned by the first read has no effect on the virtual address. This might occur if the value returned is masked off before it is used, or if it confirms a predicted address value that it might have changed.

This restriction applies only when the data value returned by a read is used as a data value to calculate the address of a subsequent read or write. It does not apply if the data value returned by a read determines the condition flags values, and the values of the flags are used for condition code evaluation to determine the address of a subsequent read, either through conditional execution or the evaluation of a branch. This is called a *control dependency*.

Where both a control and address dependency exist, the ordering behavior is consistent with the address dependency.

Table J7-1 shows examples of address dependencies, control dependencies, and an address and control dependency.

</tr>
</tbody>
</table>

a. The address dependency takes priority.

This means that the data transfer example of *Weakly-ordered message passing problem* on page J7-5531 can also be satisfied as shown in the following example:

P1

```
STR R5, [R1] ; sets new data
DMB [ST] ; ensures all observers observe data before the flag
STR R0, [R2] ; sends flag indicating data ready
```

P2

```
WAIT([R2]==1)
AND R12, R12, #0 ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12] ; the load has an address dependency on R12
; and so is ordered after the flag has been seen
```

The load of R5 by P2 is ordered with respect to the load from [R2] because there is an address dependency using R12. P1 uses a DMB to ensure that P2 does not observe the write of [R2] before the write of [R1].
Message passing with multiple observers

Where the ordering of Normal memory accesses is not resolved by the use of barriers or dependencies, then different observers might observe the accesses in a different order, as shown in the following example:

P1

STR R5, [R1] ; sets new data
STR R0, [R2] ; sends flag indicating data ready

P2

WAIT([R2]==1)
AND R12, R12, #0 ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12] ; the load has an address dependency on R12
; and so is ordered after the flag has been seen

P3

WAIT([R2]==1)
AND R12, R12, #0 ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12] ; the load is address dependent on R12
; and so is ordered after the flag has been seen

In this case, it is permissible for P2:R5 and P3:R5 to contain different values, because there is no order guaranteed between the two stores performed by P1.

Resolving by the addition of barriers

The addition of a barrier by P1, as shown in the following example, ensures the observed order of the writes, transferring data so that P2:R5 and P3:R5 both contain the value 0x55:

P1

STR R5, [R1] ; sets new data
DMB [ST] ; ensures all observers observe data before the flag
STR R0, [R2] ; sends flag indicating data ready

P2

WAIT([R2]==1)
AND R12, R12, #0 ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12] ; the load has an address dependency on R12
; and so is ordered after the flag has been seen

P3

WAIT([R2]==1)
AND R12, R12, #0 ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12] ; the load has an address dependency on R12
; and so is ordered after the flag has been seen

Address dependency with object construction

When accessing an object-oriented data structure, the address dependency rule means that barriers are not required, even when initializing the object:

P1

STR R5, [R1, #offset] ; sets new data in a field
DMB [ST] ; ensures all observers observe data before base address is updated
STR R1, [R2] ; updates base address

P2

LDR R1, [R2] ; reads for base address
CMP R1, #0 ; checks if it is valid
BEQ null_trap
J7.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

LDR R5, [R1, #offset] ; uses base address to read field

If the null_trap is not taken, it is required that P2:R5==0x55. This avoids P2 observing a partially constructed object from P1. Significantly, P2 does not require a barrier to ensure this behavior.

P1 requires a barrier to ensure the observed order of the writes by P1. In general, the impact of requiring a barrier during the construction phase is much less than the impact of requiring a barrier for every read access.

**Causal consistency issues with multiple observers**

The fact that different observers can observe memory accesses in different orders extends, in the absence of barriers, to behaviors that do not fit naturally expected causal properties, as the following example shows:

P1

```
STR R0, [R2] ; sets new data
```

P2

```
WAIT([R2]==1) ; waits to see new data from P1
STR R0, [R3] ; sends flag, must be after the new data has been by P2 as stores, ; must not be speculative
```

P3

```
WAIT([R3]==1) ; waits for P2 flag
AND R12, R12, #0 ; dependency to ensure order
LDR R0, [R2, R12] ; reads P1's data
```

In this example, P3:R0==0 is permissible. P3 is not guaranteed to see the stores from P1 and P2 in any particular order. This applies despite the fact that the store from P2 can only happen after P2 has observed the store from P1.

This example shows that the ARM memory order model for Normal memory does not conform to causal consistency. This means that the apparently transitive causal relationship between two variables is not guaranteed to be transitive.

The following example shows the insertion of a barrier by P2 to create causal consistency:

P1

```
STR R0, [R2] ; sets new data
```

P2

```
WAIT([R2]==1) ; waits to see new data from P1
DMB ; ensures P1 data is observed by all observers before any following store
STR R0, [R3] ; sends flag
```

P3

```
WAIT([R3]==1) ; waits for P2 flag
AND R12, R12, #0 ; dependency to ensure order
LDR R0, [R2, R12] ; reads P1 data
```

This creates causal consistency because a DMB is required to order all accesses that the executing PE observed before the DMB, not only those it issued, before any of the accesses that follow the DMB.

**Multiple observers of writes to multiple locations**

The ARM weakly consistent memory model means that different observers can observe writes to different locations in different orders, as the following example shows:

P1

```
STR R0, [R1] ; sets new data
```

P2
Appendix J7 Barrier Litmus Tests

J7.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

STR R0, [R2] ; sets new data
P3
  LDR R10, [R2] ; reads P2 data before P1 data
  LDR R9, [R1] ;
  BIC R9, R10, R9 ; R9 <- R10 & -R9
  ; R9 contains 1 iff read from [R2] is observed to be 1 and
  ; read from [R1] is observed to be 0.
P4
  LDR R9, [R1]
  LDR R10, [R2]
  BIC R9, R9, R10 ; R9 <- R9 & -R10
  ; R9 contains 1 iff read from [R2] is observed to be 0 and
  ; read from [R1] is observed to be 1.

In this example, the result P3:R9==1 and P4:R9==1 is permissible. This means that P3 and P4 observed the stores from P1 and P2 in different orders.

The following example shows the use of DMB instructions to ensure sequential consistency:

P1
  STR R0, [R1] ; sets new data
P2
  STR R0, [R2] ; sets new data
P3
  LDR R10, [R2] ; reads P2 data before P1 data
  DMB
  LDR R9, [R1]
  BIC R9, R10, R9 ; R9 <- R10 & -R9
  ; R9 contains 1 iff read from [R2] is observed to be 1 and
  ; read from [R1] is observed to be 0.
P4
  LDR R9, [R1] ; reads P1 data before P2 data
  DMB
  LDR R10, [R2]
  BIC R9, R9, R10 ; R9 <- R9 & -R10
  ; R9 contains 1 iff read from [R2] is observed to be 0 and
  ; read from [R1] is observed to be 1.

In this example:

- The DMB executed by P3 ensures that, if the P3 load from [R2] observes the P2 store to [R2], then all observers observe the P2 store to [R2] before they observe the P3 load from [R1].
- The DMB executed by P4 ensures that, if the P4 load from [R1] observes the P1 store to [R1], then all observers observe the P1 store to [R1] before they observe the P4 load from [R2].

If the P3 load from [R1] returns 0, then it has not observed the P1 store to [R1]. Also, if the P3 load of [R2] returns 1, then all observers must have observed the P2 store to [R2] before they observed the P1 store to [R1]. This means that P4 cannot observe the P1 store to [R1] without also observing the P2 store to [R2].

Alternatively, if the P4 load from [R2] returns 0, then it has not observed the P2 store to [R2]. If, also, the P4 load of [R1] returns 1, then all observers must have observed the P1 store to [R1] before they observed the P2 store to [R2]. This means that P3 cannot observe the P2 store to [R2] without also observing the P1 store to [R1].

This shows that, of the four possible results for {P3:R9, P4:R9}, the insertion of these barriers makes the result {1, 1} impossible.
Posting a store before polling for acknowledgement

In the case where an observer stores to a location, and then polls for an acknowledge from a different observer, the weak ordering of the memory model can lead to a deadlock, as the following example shows:

P1

```
STR R0, [R2]
WAIT ([R3]==1)
```

P2

```
WAIT ([R2]==1)
STR R0, [R3]
```

In ARMv7 implementations that do not include the Multiprocessing Extensions, then this can deadlock because P2 might not observe the store by P1 in finite time. For ARMv7 implementations with the Multiprocessing Extensions and for ARMv8, this is not an issue as all stores must be observed by all observers within their shareability domain in finite time.

The addition of a DMB instruction prevents this deadlock in ARMv7 implementations that do not include the Multiprocessing Extensions:

P1

```
STR R0, [R2]
DMB
WAIT ([R3]==1)
```

P2

```
WAIT ([R2]==1)
STR R0, [R3]
```

The DMB executed by P1 ensures that P2 observes the store by P1 before it observes the load by P1. This ensures a timely completion.

The following example is a variant of the previous example, where the two observers poll the same memory location:

P1

```
STR R0, [R2]
WAIT ([R2]==2)
```

P2

```
WAIT ([R2]==1)
LDR R0, [R2]
ADD R0, R0, #1
STR R0, [R2]
```

In this example, the same deadlock can occur, because the architecture permits P1 to read the result of its own store to [R2] early, and continue doing so for an indefinite amount of time. The addition of a DMB instruction prevents this deadlock:

P1

```
STR R0, [R2]
DMB
WAIT ([R2]==2)
```

P2

```
WAIT ([R2]==1)
LDR R0, [R2]
ADD R0, R0, #1
STR R0, [R2]
```
WFE and WFI and barriers

The Wait For Event and Wait For Interrupt instructions permit the PE to suspend execution and enter a low-power state. A DSB barrier instruction is required if it is necessary to ensure that memory accesses made before the WFI or WFE are visible to other observers, unless some other mechanism has ensured this visibility. Examples of other mechanisms that would guarantee the required visibility are the DMB described in Posting a store before polling for acknowledgement on page J7-5536, or a dependency on a load.

The following example requires the DSB to ensure that the store is visible:

\[
P1 \\
\text{STR R0, [R2]} \\
\text{DSB} \\
\text{Loop} \\
\text{WFI} \\
\text{B Loop}
\]

However, if the example in Posting a store before polling for acknowledgement on page J7-5536 is extended to include a WFE, there is no risk of a deadlock. The extended example is:

\[
P1 \\
\text{STR R0, [R2]} \\
\text{DMB} \\
\text{Loop} \\
\text{LDR R12, [R3]} \\
\text{CMP R12, #1} \\
\text{WFENE} \\
\text{BNE Loop}
\]

\[
P2 \\
\text{WAIT ([R2]==1)} \\
\text{STR R0, [R3]} \\
\text{DSB} \\
\text{SEV}
\]

In this example:

- The DMB by P1 ensures that P2 observes the store by P1 before it observes the load by P1.
- The dependency of the WFE on the result of the load by P1 means that this load must complete before P1 executes the WFE.

For more information about SEV, see Use of Wait For Event (WFE) and Send Event (SEV) with locks on page J7-5538.

J7.6.2 Load-Exclusive, Store-Exclusive and barriers

The Load-Exclusive and Store-Exclusive instructions, described in Synchronization and semaphores on page B2-107, are predictable only with Normal memory. These instructions do not have any implicit barrier functionality. Therefore, any use of these instructions to implement locks of any type requires the addition of explicit barriers.

Acquiring a lock

A common use of Load-Exclusive and Store-Exclusive instructions is to claim a lock to permit entry into a critical region. This is typically performed by testing a lock variable that indicates 0 for a free lock and some other value, commonly 1 or an identifier of the process holding the lock, for a taken lock.

The lack of implicit barriers in the Load-Exclusive and Store-Exclusive instructions means that the mechanism requires a DMB instruction between acquiring a lock and making the first access to the critical region, to ensure that all observers observe the successful claim of the lock before they observe any subsequent loads or stores to the region. This example shows Px acquiring a lock:
Appendix J7 Barrier Litmus Tests

J7.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

Releasing a lock

The converse operation of releasing a lock does not require the use of Load-Exclusive and Store-Exclusive instructions, because only a single observer is able to write to the lock. However, often it is necessary for any observer to observe any memory updates, or any values that are loaded into memory, before they observe the release of the lock. Therefore, a DMB usually precedes the lock release, as the following example shows.

```
Px
; loads and stores in the critical region
MOV R0, #0
DMB ; ensures all previous accesses are observed before the lock is cleared
STR R0, [R1] ; clears the lock
```

Use of Wait For Event (WFE) and Send Event (SEV) with locks

The ARMv8 architecture includes Wait For Event and Send Event instructions, that can be executed to reduce the required number of iterations of a lock-acquire loop, or spinlock, to reduce power. The basic mechanism involves an observer that is in a spinlock executing a WFE instruction that suspends execution on that observer until an asynchronous exception or an explicit event, sent by some other observer using the SEV instruction, is seen by the suspended observer. An observer that holds the lock executes an SEV instruction to send an event after it has released the lock.

The Event signal is a non-memory communication, and therefore the memory update that releases the lock must be observable by all observers before the SEV instruction is executed and the event is sent. This requires the use of DSB instruction, rather than DMB.

Therefore, the following is an example of lock acquire code using WFE:

```
Px
Loop
LDREX R5, [R1] ; reads lock
CMP R5, #0 ; checks if 0
WFENE ; sleeps if the lock is held
STRESEQ R5, R0, [R1] ; attempts to store new value
CMPEQ R5, #0 ; tests if store succeeded
BNE Loop ; retries if not
DMB ; ensures that all subsequent accesses are observed after the
; gaining of the lock is observed
; loads and stores in the critical region can now be performed
```

And the following is an example of lock release code using SEV:

```
Px
; loads and stores in the critical region
MOV R0, #0
DMB ; ensures all previous accesses are observed before the lock is cleared
STR R0, [R1] ; clears the lock
DSB ; ensures completion of the store that cleared the lock before
SEV ; sending the event
```
### J7.6.3 Using a mailbox to send an interrupt

In some message passing systems, it is common for one observer to update memory and then notify a second observer of the update by sending an interrupt, using a mailbox.

Although a memory access might be made to initiate the sending of the mailbox interrupt, a `DSB` instruction is required to ensure the completion of previous memory accesses.

Therefore, the following sequence is required to ensure that P2 observes the updated value:

**P1**

```
STR R5, [R1] ; message stored to shared memory location
DSB [ST]
STR R1, [R4] ; R4 contains the address of a mailbox
```

**P2**

```
; interrupt service routine
LDR R5, [R1]
```

--- Note ---

The `DSB` executed by P1 ensures global observation of the store to [R1]. The interrupt timing ensures that the code executed by P2 is executed after the global observation of the update to [R1], and therefore must see this update. In some implementations, this might be implemented by requiring that interrupts flush non-coherent buffers that hold speculatively loaded data.

### J7.6.4 Cache and TLB maintenance instructions and barriers

The following sections describe the use of barriers with cache and TLB maintenance instructions:

- [Data cache maintenance instructions.](#)
- [Instruction cache maintenance instructions on page J7-5542.](#)
- [TLB maintenance instructions and barriers on page J7-5543.](#)

#### Data cache maintenance instructions

The following sections describe the use of barriers with data cache maintenance instructions:

- [Message passing to non-caching observers.](#)
- [Multiprocessing message passing to non-caching observers on page J7-5540.](#)
- [Invalidating DMA buffers, non-functional example on page J7-5540.](#)
- [Invalidating DMA buffers, functional example with single PE on page J7-5541.](#)
- [Invalidating DMA buffers, functional example with multiple coherent PEs on page J7-5541.](#)

#### Message passing to non-caching observers

The ARMv8 architecture requires the use of `DMB` instructions to ensure the ordering of data cache maintenance instructions and their effects. This means the following message passing approaches can be used when communicating between caching observers and non-caching observers:

**P1**

```
STR R5, [R1] ; updates data (assumed to be in P1's cache)
DCCMVAC R1 ; cleans cache to point of coherency
DMB ; ensures effects of the clean will be observed before the flag is set
STR R0, [R4] ; sends flag to external agent (Non-cacheable location)
```
J7 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

E1

WAIT ([R4] == 1) ; waits for the flag
DMB ; ensures that flag has been seen before reading data
LDR R5, [R1] ; reads the data

In this example, it is required that E1:R5==0x55.

Multiprocessing message passing to non-caching observers

The broadcast nature of the cache maintenance instructions in ARMv8, and in ARMv7 implementations that include the Multiprocessing Extensions, combined with properties of barriers, means that the message passing principle for non-caching observers is:

P1

STR R5, [R1] ; updates data (assumed to be in P1's cache)
DMB [ST] ; ensures new data is observed before the flag to P2 is set
STR R0, [R2] ; sends flag to P2

P2

WAIT ([R2] == 1) ; waits for flag from P1
DMB ; ensures cache clean is observed after P1 flag is observed
DCCMVAC R1 ; cleans cache to point of coherency - this cleans the cache of P1
DMB ; ensures effects of the clean are observed before the flag to E1 is set
STR R0, [R4] ; sends flag to E1

E1

WAIT ([R4] == 1) ; waits for flag from P2
DMB ; ensures that flag has been observed before reading the data
LDR R5, [R1] ; reads the data

In this example, it is required that E1:R5==0x55. The clean operation executed by P2 affects the data location in the P1 cache. The cast-out from the P1 cache is guaranteed to be observed before P2 updates [R4].

Invalidating DMA buffers, non-functional example

The basic scheme for communicating with an external observer that is a process that passes data in to a Cacheable memory region must take account of the architectural requirement that regions marked as Cacheable can be allocated into a cache at any time, for example as a result of speculation. The following example shows this possibility:

P1

DCIMVAC R1 ; ensures caches are not dirty. A clean operation could be
; used but the DMA overwrites this region so an invalidate operation
; is sufficient and usually more efficient
DMB ; ensures cache invalidation is observed before the next store is observed
STR R0, [R3] ; sends flag to external agent
WAIT ([R4]==1) ; waits for a different flag from an external agent
DMB ; observes flag from external agent before reading new data. However [R1]
; could have been brought into cache earlier
LDR R5, [R1]

E1

WAIT ([R3] == 1) ; waits for flag
STR R5, [R1] ; stores new data
DMB
STR R0, [R4] ; sends a flag

If a speculative access occurs, there is no guarantee that the cache line containing [R1] is not brought back into the cache after the cache invalidation, but before [R1] is written by E1. Therefore, the result P1:R5=0 is permissible.
Invalidating DMA buffers, functional example with single PE

P1

DCIMVAC R1 ; ensures cache is not dirty. A clean operation could be
; used but the DMA overwrites this region so an invalidate operation
; is sufficient and usually more efficient
DMB ; ensures cache invalidation is observed before the next store is observed
STR R0, [R3] ; sends flag to external agent
WAIT (R4==1) ; waits for a different flag from an external agent
DMB ; ensures that cache invalidate is observed after the flag
; from external agent is observed
DCIMVAC R1 ; ensures cache discards stale copies before use
LDR R5, [R1]

E1

WAIT (R3 == 1) ; waits for flag
STR R5, [R1] ; stores new data
DMB [ST]
STR R0, [R4] ; sends a flag

In this example, the result P1:R5 == 0x55 is required. Including a cache invalidation after the store by E1 to [R1] is observed ensures that the line is fetched from external memory after it has been updated.

Invalidating DMA buffers, functional example with multiple coherent PEs

The broadcasting of cache maintenance instructions, and the use of DMB instructions to ensure their observability, means that the previous example extends naturally to a multiprocessor system. Typically this requires a transfer of ownership of the region that the external observer is updating.

P0

(Use data from [R1], potentially using [R1] as scratch space)
DMB
STR R0, [R2] ; signals release of [R1]
WAIT (R2==0) ; waits for new value from DMA
DMB
LDR R5, [R1]

P1

WAIT (R2 == 1) ; waits for release of [R1] by P0
DCIMVAC R1 ; ensures caches are not dirty, invalidate is sufficient
DMB
STR R0, [R3] ; requests new data for [R1]
WAIT (R4==1) ; waits for new data
DMB
DCIMVAC R1 ; ensures caches discard stale copies before use
DMB
MOV R0, #0
STR R0, [R2] ; signals availability of new [R1]

E1

WAIT (R3 == 1) ; waits for new data request
STR R5, [R1] ; sends new [R1]
DMB [ST]
STR R0, [R4] ; indicates new data available to P1

In this example, the result P0:R5 == 0x55 is required. The DMB issued by P1 after the first data cache invalidation ensures that effect of the cache invalidation on P0 is seen by E1 before the store by E1 to [R1]. The DMB issued by P1 after the second data cache invalidation ensures that its effects are seen before the store of 0 to the semaphore location in [R2].
Instruction cache maintenance instructions

The following sections describe the use of barriers with instruction cache maintenance instructions:

- Ensuring the visibility of updates to instructions for a uniprocessor.
- Ensuring the visibility of updates to instructions for a multiprocessor.

Ensuring the visibility of updates to instructions for a uniprocessor

On a single PE, the agent that causes instruction fetches, or instruction cache linefills, is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the instruction cache can rely only on seeing updates to memory that are complete. This must be ensured by the use of a DSB instruction.

Also, instruction cache maintenance instructions are only guaranteed to complete after the execution of a DSB, and an ISB is required to discard any instructions that might have been prefetched before the instruction cache invalidation completed. Therefore, on a uniprocessor, to ensure the visibility of an update to code and to branch to it, the following sequence is required:

P1

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STR R11, [R1]</td>
<td>R11 contains a new instruction to store in program memory</td>
</tr>
<tr>
<td>DCCMVAU R1</td>
<td>clean to PoU makes new instructions visible to instruction cache</td>
</tr>
<tr>
<td>DSB</td>
<td>ensures instruction cache and branch predictor discard stale data</td>
</tr>
<tr>
<td>ICIVMAU R1</td>
<td>ensures completion of the clean on all processors</td>
</tr>
<tr>
<td>BPIMVAU R1</td>
<td>ensures instruction cache/branch predictor discards stale data</td>
</tr>
<tr>
<td>DSB</td>
<td>ensures completion of the instruction cache and branch predictor</td>
</tr>
<tr>
<td>ISB</td>
<td>synchronizes context on this PE</td>
</tr>
<tr>
<td>BX R1</td>
<td>branches to new code</td>
</tr>
</tbody>
</table>

Ensuring the visibility of updates to instructions for a multiprocessor

ARMv8, and an ARMv7 implementation that includes the Multiprocessing Extensions, requires a PE that executes an instruction cache maintenance instruction to execute a DSB instruction to ensure completion of the maintenance operation. This ensures that the cache maintenance instruction is complete on all PEs in the Inner Shareable shareability domain.

An ISB is not broadcast, and so does not affect other PEs. This means that any other PE must perform its own ISB synchronization after it knows that the update is visible, if it is necessary to ensure its synchronization with the update. The following example shows how this might be done:

P1

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STR R11, [R1]</td>
<td>R11 contains a new instruction to store in program memory</td>
</tr>
<tr>
<td>DCCMVAU R1</td>
<td>clean to PoU makes new instructions visible to instruction cache</td>
</tr>
<tr>
<td>DSB</td>
<td>ensures completion of the clean on all processors</td>
</tr>
<tr>
<td>ICIVMAU R1</td>
<td>ensures instruction cache/branch predictor discards stale data</td>
</tr>
<tr>
<td>BPIMVAU R1</td>
<td>ensures completion of the instruction cache and branch predictor</td>
</tr>
<tr>
<td>DSB</td>
<td>invalidation on all PEs</td>
</tr>
<tr>
<td>STR R0, [R2]</td>
<td>sets flag to signal completion</td>
</tr>
<tr>
<td>ISB</td>
<td>synchronizes context on this PE</td>
</tr>
<tr>
<td>BX R1</td>
<td>branches to new code</td>
</tr>
</tbody>
</table>

P2-Px

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WAIT ([R2] == 1)</td>
<td>waits for flag signaling completion</td>
</tr>
<tr>
<td>ISB</td>
<td>synchronizes context on this processor</td>
</tr>
<tr>
<td>BX R1</td>
<td>branches to new code</td>
</tr>
</tbody>
</table>
**Nonfunctional approach**

The following sequence does not have the same effect, because a `DSB` is not required to complete the instruction cache maintenance instructions that other PEs issue:

P1

```
STR R11, [R1] ; R11 contains a new instruction to store in program memory
DCCMVAU R1 ; clean to PoU makes new instructions visible to instruction cache
DSB ; ensure completion of the clean on all PEs
ICIMVAU R1 ; ensure instruction cache/branch predictor discards stale data
BPIMVA R1
DMB ; ensure ordering of the store after the invalidation
; DOES NOT guarantee completion of instruction cache/branch predictor on other PEs
STR R0, [R2] ; sets flag to signal completion
DSB ; ensures completion of the invalidation on all PEs
ISB ; synchronizes context on this PE
BX R1 ; branches to new code
```

In this example, P2…Px might not see the updated region of code at R1.

**TLB maintenance instructions and barriers**

The following sections describe the use of barriers with TLB maintenance instructions:

- *Ensuring the visibility of updates to translation tables for a uniprocessor.*
- *Ensuring the visibility of updates to translation tables for a multiprocessor* on page J7-5544.
- *Paging memory in and out* on page J7-5544.

**Ensuring the visibility of updates to translation tables for a uniprocessor**

On a single PE, the agent that causes translation table walks is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the TLB can only rely on seeing updates to memory that are complete. This must be ensured by the use of a `DSB` instruction.

In the ARMv8 architecture, and in an ARMv7 implementation that includes the Multiprocessing Extensions, translation table walks must look in the data or unified caches at L1, so such systems do not require data cache cleaning.

After the translation tables update, any old copies of entries that might be held in the TLBs must be invalidated. This operation is only guaranteed to affect all instructions, including instruction fetches and data accesses, after the execution of a `DSB` and an `ISB`. Therefore, the code for updating a translation table entry is:

P1

```
STR R11, [R1] ; updates the translation table entry

Appendix J7 Barrier Litmus Tests

J7.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

![](image)

Importantly, by the end of this sequence, all accesses that used the old translation table mappings have been observed by all observers.

An example of this is where a translation table entry is marked as invalid. Such a system must provide a mechanism to ensure that any access to a region of memory being marked as invalid has completed before any action is taken as a result of the region being marked as invalid.

**Ensuring the visibility of updates to translation tables for a multiprocessor**

The same code sequence can be used in a multiprocessing system. In the ARMv8 architecture, and in an ARMv7 implementation that includes the Multiprocessing Extensions, a PE that executes a TLB maintenance instruction must execute a DSB instruction to ensure completion of the maintenance operation. This ensures that the TLB maintenance instruction is complete on all PEs in the Inner Shareable shareability domain.

The completion of a DSB that completes a TLB maintenance instruction ensures that all accesses that used the old mapping have completed.

P1

```
STR R11, [R1]            ; updates the translation table entry
DSB                      ; ensures visibility of the update to translation table walks
TLBIMVAIS R10
BPIALLIS
DSB                      ; ensures completion of the BP and TLB invalidation
ISB                      ; Note ISB is not broadcast and must be executed locally on other PEs
; new translation table entry can be relied upon at this point and all accesses generated by any
; observers affected by the broadcast TLBIMVAIS operation using the old mapping have completed
```

The completion of the TLB maintenance instruction is guaranteed only by the execution of a DSB by the observer that performed the TLB maintenance instruction. The execution of a DSB by a different observer does not have this effect, even if the DSB is known to be executed after the TLB maintenance instruction is observed by that different observer.

**Paging memory in and out**

In a multiprocessor system there is a requirement to ensure the visibility of translation table updates when paging regions of memory into RAM from a backing store. This might, or might not, also involve paging existing locations in memory from RAM to a backing store. In such situations, the operating system selects one or more pages of memory that might be in use but are suitable to discard, with or without copying to a backing store, depending on whether or not the region of memory is writable. Disabling the translation table mappings for a page, and ensuring the visibility of that update to the translation tables, prevents agents accessing the page.

For this reason, it is important that the DSB that is performed after the TLB invalidation ensures that no other updates to memory using those mappings are possible.

An example sequence for the paging out of an updated region of memory, and the subsequent paging in of memory, is as follows:

P1

```
STR R11, [R1]            ; updates the translation table for the region being paged out
DSB                      ; ensures visibility of the update to translation table walks
TLBIMVAIS R10            ; invalidates the old entry
DSB                      ; ensures completion of the invalidation on all processors
ISB                      ; ensures visibility of the invalidation
BL SaveMemoryPageToBackingStore
BL LoadMemoryFromBackingStore
DSB                      ; ensures completion of the memory transfer (this could be part of
ICIALLUI5                ; also invalidates the branch predictor
STR R9, [R1]             ; creates a new translation table entry with a new mapping
```
DSB                      ; ensures completion of instruction cache and branch predictor invalidation
                        ; and ensures visibility of the new translation table mapping
ISB                      ; ensures synchronization of this instruction stream

This example assumes the memory copies are performed by an observer that is coherent with the caches of PE P1. This observer might be P1 itself, using a specific paging mapping. For clarity, the example omits the functional descriptions of SaveMemoryPageToBackingStore and LoadMemoryFromBackingStore. LoadMemoryFromBackingStore is required to ensure that the memory updates that it makes are visible to instruction fetches.

In this example, the use of ICIALLUIS to invalidate the entire instruction cache is a simplification, that might not be optimal for performance. An alternative approach involves invalidating all of the lines in the caches using ICIMVAU operations. This invalidation must be done when the mapping used for the ICIMVAU operations is valid but not executable.

Appendix J8
ARMv8 Pseudocode Library

This appendix contains the ARMv8 pseudocode library. It contains the following sections:

- Library pseudocode for AArch64 on page J8-5548.
- Library pseudocode for AArch32 on page J8-5608.
- Common library pseudocode on page J8-5680.

Note
Status of this appendix in the beta release document

ARM is currently working to improve the organization and presentation of the pseudocode in this document, including providing improved linking within the pseudocode. Currently, this chapter contains the complete pseudocode library for ARMv8, split between:

- Functions, or versions of functions, that are specific to execution in AArch64 state.
- Functions, or versions of functions, that are specific to execution in AArch32 state.
- Functions that apply to execution in either Execution state.

Many pseudocode functions are included elsewhere in the document, to accompany the description of the associated functionality. Currently, those functions are repeated in this appendix.
J8.1 Library pseudocode for AArch64

This section holds the pseudocode for execution in AArch64 state. Functions listed in this section are identified as AArch64.FunctionName. Some of these functions have an equivalent AArch32 function, AArch32.FunctionName. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example aarch64/debug/breakpoint.

The top-level sections of the AArch64 pseudocode hierarchy are:
- aarch64/debug.
- aarch64/exceptions.
- aarch64/functions.
- aarch64/intrs.
- aarch64/translation.

J8.1.1 aarch64/debug

This section includes the following pseudocode functions used by debug in AArch64 state:
- aarch64/debug/breakpoint/AArch64.BreakpointMatch.
- aarch64/debug/breakpoint/AArch64.BreakpointValueMatch on page J8-5549.
- aarch64/debug/breakpoint/AArch64.StateMatch on page J8-5550.
- aarch64/debug/enable/AArch64.GenerateDebugExceptions on page J8-5551.
- aarch64/debug/enable/AArch64.GenerateDebugExceptionsFrom on page J8-5551.
- aarch64/debug/pmuc/AArch64.CheckForPMUOverflow on page J8-5551.
- aarch64/debug/pmuc/AArch64.CountEvents on page J8-5551.
- aarch64/debug/pmuc/AArch64.ProfilingProhibited on page J8-5552.
- aarch64/debug/takeexceptiondbg/AArch64.TakeExceptionInDebugState on page J8-5552.
- aarch64/debug/watchpoint/AArch64.WatchpointByteMatch on page J8-5553.
- aarch64/debug/watchpoint/AArch64.WatchpointMatch on page J8-5554.

J8.2 Library pseudocode for AArch32

This section holds the pseudocode for execution in AArch32 state. Functions listed in this section are identified as AArch32.FunctionName. Some of these functions have an equivalent AArch64 function, AArch64.FunctionName. This section is organised by functional groups, with the functional groups being indicated by hierarchical path names, for example aarch32/debug/breakpoint.

The top-level sections of the AArch32 pseudocode hierarchy are:
- aarch32/debug
- aarch32/exceptions on page J8-5616.
- aarch32/functions on page J8-5633.
- aarch32/translation on page J8-5659.

J8.2.1 aarch32/debug

This section includes the following pseudocode functions used by debug in AArch32 state:
- aarch32/debug/enable/AArch32.EnableDebug
- aarch32/debug/enable/AArch32.GenerateDebugExceptions
- aarch32/debug/enable/AArch32.GenerateDebugExceptionsFrom
- aarch32/debug/pm/AArch32.CheckForPMUOverflow
- aarch32/debug/pm/AArch32.CountEvents
- aarch32/debug/pm/AArch32.ProfilingProhibited
- aarch32/debug/takeexceptiondbg/AArch32.EnterHypModeInDebugState
- aarch32/debug/takeexceptiondbg/AArch32.EnterModeInDebugState
- aarch32/debug/takeexceptiondbg/AArch32.EnterMonitorModeInDebugState
- aarch32/debug/watchpoint/AArch32.WatchpointBitMatch
- aarch32/debug/watchpoint/AArch32.WatchpointByteMatch

J8.3  Common library pseudocode

This section holds the pseudocode that is common to execution in AArch64 state and in AArch32 state. Functions listed in this section are identified only by a FunctionName, without an AArch64 or AArch32 prefix. This section is organised by functional groups, with the functional groups being indicated by hierarchical path names, for example shared/debug/DebugTarget.

The top-level sections of the shared pseudocode hierarchy are:

- shared/debug
- shared/exceptions on page J8-5696.
- shared/functions on page J8-5698.
- shared/translation on page J8-5750.

J8.3.1  shared/debug

This section includes the following pseudocode functions used by debug in both AArch32 and AArch64 states:

- shared/debug/DebugTarget/DebugTarget on page J8-5681.
- shared/debug/DebugTarget/DebugTargetFrom on page J8-5681.
- shared/debug/FindWatchpoint/FindWatchpoint on page J8-5682.
- shared/debug/authentication/AllowExternalDebugAccess on page J8-5682.
- shared/debug/authentication/AllowExternalPMUAccess on page J8-5682.
- shared/debug/authentication/Debug_authentication on page J8-5683.
- shared/debug/authentication/ExternalNoninvasiveDebugEnabled on page J8-5683.
- shared/debug/cti/CTI_SetEventLevel on page J8-5684.
- shared/debug/cti/CTI_SignalEvent on page J8-5684.
- shared/debug/cti/CrossTrigger on page J8-5684.
- shared/debug/dccanditr/CheckForDCCInterrupts on page J8-5684.
- shared/debug/dccanditr/DBGDTRRX_EL0 on page J8-5684.
- shared/debug/dccanditr/DBGDTRTX_EL0 on page J8-5685.
- shared/debug/dccanditr/DBGDTR_EL0 on page J8-5686.

Appendix J9
ARM Pseudocode Definition

This appendix provides a definition of the pseudocode used in this manual, and defines some helper procedures and functions used by pseudocode. It contains the following sections:

- About the ARM pseudocode on page J9-5758.
- Pseudocode for instruction descriptions on page J9-5759.
- Data types on page J9-5761.
- Expressions on page J9-5765.
- Operators and built-in functions on page J9-5767.
- Statements and program structure on page J9-5772.
- Miscellaneous helper procedures and functions on page J9-5776.

Note
Status of this appendix in the beta release document

ARM is currently working to improve the organization and presentation of the pseudocode in this document. Currently, this chapter contains the ARMv7 definition, and needs updating to incorporate changes and extensions to the pseudocode made for ARMv8. These updates will appear in the next issue of this manual.

The pseudocode in this manual describes ARMv8 execution in both AArch32 state and AArch64 state. It does not describe differences in earlier versions of the architecture.
J9.1 About the ARM pseudocode

See the Note on the front page of this appendix, Status of this appendix in the beta release document on page J9-5757.

The ARM pseudocode provides precise descriptions of some areas of the ARM architecture. This includes description of the decoding and operation of all valid instructions. Pseudocode for instruction descriptions on page J9-5759 gives general information about this instruction pseudocode, including its limitations.

The following sections describe the ARM pseudocode in detail:

- Data types on page J9-5761.
- Expressions on page J9-5765.
- Operators and built-in functions on page J9-5767.
- Statements and program structure on page J9-5772.

Miscellaneous helper procedures and functions on page J9-5776 describes some pseudocode helper functions, that are used by the pseudocode functions that are described elsewhere in this manual. Appendix J10 contains the indexes to the pseudocode.

J9.1.1 General limitations of ARM pseudocode

The pseudocode statements IMPLEMENTATION_DEFINED, SEE, UNDEFINED, and UNPREDICTABLE indicate behavior that differs from that indicated by the pseudocode being executed. If one of them is encountered:

- Earlier behavior indicated by the pseudocode is only specified as occurring to the extent required to determine that the statement is executed.
- No subsequent behavior indicated by the pseudocode occurs. This means that these statements terminate pseudocode execution.

For more information, see Simple statements on page J9-5772.
Appendix J9 ARM Pseudocode Definition
J9.2 Pseudocode for instruction descriptions

Each instruction description includes pseudocode that provides a precise description of what the instruction does, subject to the limitations described in General limitations of ARM pseudocode on page J9-5758 and Limitations of the instruction pseudocode on page J9-5760.

In the instruction pseudocode, instruction fields are referred to by the names shown in the encoding diagram for the instruction. Instruction encoding diagrams and instruction pseudocode gives more information about the pseudocode provided for each instruction.

J9.2.1 Instruction encoding diagrams and instruction pseudocode

Note
Currently this appendix only describes A32/T32 instruction pseudocode.

Instruction descriptions in this manual contain:
- An Encoding section, containing one or more encoding diagrams, each followed by some encoding-specific pseudocode that translates the fields of the encoding into inputs for the common pseudocode of the instruction, and picks out any encoding-specific special cases.
- An Operation section, containing common pseudocode that applies to all of the encodings being described. The Operation section pseudocode contains a call to the EncodingSpecificOperations() function, either at its start or only after a condition code check performed by if ConditionPassed() then.

An encoding diagram specifies each bit of the instruction as one of the following:
- An obligatory 0 or 1, represented in the diagram as 0 or 1. If this bit does not have this value, the encoding corresponds to a different instruction.
- A should be 0 or 1, represented in the diagram as (0) or (1). If this bit does not have this value, the instruction is UNPREDICTABLE. For more information, see SBZ or SBO fields in instructions on page J1-5366.
- A named single bit or a bit in a named multi-bit field. The cond field in bits[31:28] of many A32/T32 instructions has some special rules associated with it.

An encoding diagram matches an instruction if all obligatory bits are identical in the encoding diagram and the instruction, and one of the following is true:
- The encoding diagram is not for an A32/T32 instruction.
- The encoding diagram is for an A32/T32 instruction that does not have a cond field in bits[31:28].
- The encoding diagram is for an A32/T32 instruction that has a cond field in bits[31:28], and bits[31:28] of the instruction are not 0b1111.

In the context of the instruction pseudocode, the execution model for an instruction is:

1. Find all encoding diagrams that match the instruction. It is possible that no encoding diagram matches. In that case, abandon this execution model and consult the relevant instruction set chapter instead to find out how the instruction is to be treated. The bit pattern of such an instruction is usually reserved and UNDEFINED, though there are some other possibilities. For example, unallocated hint instructions are documented as being reserved and executed as NOPs.

2. If the operation pseudocode for the matching encoding diagrams starts with a condition code check, perform that check. If the condition code check fails, abandon this execution model and treat the instruction as a NOP. If there are multiple matching encoding diagrams, either all or none of their corresponding pieces of common pseudocode start with a condition code check.

3. Perform the encoding-specific pseudocode for each of the matching encoding diagrams independently and in parallel. Each such piece of encoding-specific pseudocode starts with a bitstring variable for each named bit or multi-bit field in its corresponding encoding diagram, named the same as the bit or multi-bit field and initialized with the values of the corresponding bit or bits from the bit pattern of the instruction.
In a few cases, the encoding diagram contains more than one bit or field with same name. In these cases, the values of the different instances of those bits or fields must be identical. The encoding-specific pseudocode contains a special case using the `Consistent()` function to specify what happens if they are not identical. `Consistent()` returns `TRUE` if all instruction bits or fields with the same name as its argument have the same value, and `FALSE` otherwise.

If there are multiple matching encoding diagrams, all but one of the corresponding pieces of pseudocode must contain a special case that indicates that it does not apply. Discard the results of all such pieces of pseudocode and their corresponding encoding diagrams.

There is now one remaining piece of pseudocode and its corresponding encoding diagram left to consider. This pseudocode might also contain a special case, most commonly one indicating that it is `UNPREDICTABLE`. If so, abandon this execution model and treat the instruction according to the special case.

4. Check the *should be* bits of the encoding diagram against the corresponding bits of the bit pattern of the instruction. If any of them do not match, abandon this execution model and treat the instruction as `UNPREDICTABLE`.

5. Perform the rest of the operation pseudocode for the instruction description that contains the encoding diagram. That pseudocode starts with all variables set to the values they were left with by the encoding-specific pseudocode.

The `ConditionPassed()` call in the common pseudocode, if present, performs step 2, and the `EncodingSpecificOperations()` call performs steps 3 and 4.

### J9.2.2 Limitations of the instruction pseudocode

The pseudocode descriptions of instruction functionality have a number of limitations. These are mainly due to the fact that, for clarity and brevity, the pseudocode is a sequential and mostly deterministic language.

These limitations include:

- Pseudocode does not describe the ordering requirements when an instruction generates multiple memory accesses. For a description of the ordering requirements on memory accesses see Ordering requirements on page E2-2445.

- Pseudocode does not describe the exact rules when an UNDEFINED instruction fails its condition code check. In such cases, the UNDEFINED pseudocode statement lies inside the `if ConditionPassed() then ...` structure, either directly or in the `EncodingSpecificOperations()` function call, and so the pseudocode indicates that the instruction executes as a NOP. Conditional execution of undefined instructions on page G1-3877 describes the exact rules.

- Pseudocode does not describe the exact ordering requirements when a single floating-point instruction generates more than one floating-point exception and one or more of those floating-point exceptions is trapped. Combinations of floating-point exceptions on page E1-2399 describes the exact rules.

  **Note**

  There is no limitation in the case where all the floating-point exceptions are untrapped, because the pseudocode specifies the same behavior as the cross-referenced section.

- An exception can be taken during execution of the pseudocode for an instruction, either explicitly as a result of the execution of a pseudocode function such as `Abort()`, or implicitly, for example if an interrupt is taken during execution of an LDM instruction. If this happens, the pseudocode does not describe the extent to which the normal behavior of the instruction occurs. To determine that, see the descriptions of the exceptions in Handling exceptions that are taken to an Exception level using AArch32 on page G1-3841.
J9.3 Data types

This section describes:
- General data type rules.
- Bitstrings.
- Integers on page J9-5762.
- Reals on page J9-5762.
- Booleans on page J9-5762.
- Enumerations on page J9-5762.
- Lists on page J9-5763.
- Arrays on page J9-5764.

J9.3.1 General data type rules

ARM architecture pseudocode is a strongly-typed language. Every constant and variable is of one of the following types:
- Bitstring.
- Integer.
- Boolean.
- Real.
- Enumeration.
- List.
- Array.

The type of a constant is determined by its syntax. The type of a variable is normally determined by assignment to the variable, with the variable being implicitly declared to be of the same type as whatever is assigned to it. For example, the assignments x = 1, y = '1', and z = TRUE implicitly declare the variables x, y and z to have types integer, bitstring of length 1, and Boolean, respectively.

Variables can also have their types declared explicitly by preceding the variable name with the name of the type. This is most often done in function definitions for the arguments and the result of the function.

The remaining subsections describe each data type in more detail.

J9.3.2 Bitstrings

A bitstring is a finite-length string of 0s and 1s. Each length of bitstring is a different type. The minimum permitted length of a bitstring is 1.

The type name for bitstrings of length $N$ is bits($N$). A synonym of bits(1) is bit.

Bitstring constants are written as a single quotation mark, followed by the string of 0s and 1s, followed by another single quotation mark. For example, the two constants of type bit are '0' and '1'. Spaces can be included in bitstrings for clarity.

A special form of bitstring constant with 'x' bits is permitted in bitstring comparisons, see Equality and non-equality testing on page J9-5767.

Every bitstring value has a left-to-right order, with the bits being numbered in standard little-endian order. That is, the leftmost bit of a bitstring of length $N$ is bit $(N-1)$ and its right-most bit is bit 0. This order is used as the most-significant-to-least-significant bit order in conversions to and from integers. For bitstring constants and bitstrings derived from encoding diagrams, this order matches the way they are printed.

Bitstrings are the only concrete data type in pseudocode, in the sense that they correspond directly to the contents of registers, memory locations, instructions, and so on. All of the remaining data types are abstract.
Appendix J9 ARM Pseudocode Definition

J9.3 Data types

J9.3.3 Integers

Pseudocode integers are unbounded in size and can be either positive or negative. That is, they are mathematical integers rather than what computer languages and architectures commonly call integers. Computer integers are represented in pseudocode as bitstrings of the appropriate length, associated with suitable functions to interpret those bitstrings as integers.

The type name for integers is \texttt{integer}.

Integer constants are normally written in decimal, such as 0, 15, -1234. They can also be written in C-style hexadecimal, such as \texttt{0x55} or \texttt{0x80000000}. Hexadecimal integer constants are treated as positive unless they have a preceding minus sign. For example, \texttt{0x80000000} is the integer \texttt{+2^{31}}. If \texttt{-2^{31}} needs to be written in hexadecimal, it must be written as \texttt{-0x80000000}.

J9.3.4 Reals

Pseudocode reals are unbounded in size and precision. That is, they are mathematical real numbers, not computer floating-point numbers. Computer floating-point numbers are represented in pseudocode as bitstrings of the appropriate length, associated with suitable functions to interpret those bitstrings as reals.

The type name for reals is \texttt{real}.

Real constants are written in decimal with a decimal point. This means 0 is an integer constant, but 0.0 is a real constant.

J9.3.5 Booleans

A Boolean is a logical \texttt{TRUE} or \texttt{FALSE} value.

The type name for Booleans is \texttt{boolean}. This is not the same type as \texttt{bit}, which is a length-1 bitstring. Boolean constants are \texttt{TRUE} and \texttt{FALSE}.

J9.3.6 Enumerations

An enumeration is a defined set of symbolic constants, such as:

\begin{verbatim}
enumeration InstrSet {InstrSet_A32, InstrSet_T32};
\end{verbatim}

An enumeration always contains at least one symbolic constant, and a symbolic constant must not be shared between enumerations.

Enumerations must be declared explicitly, although a variable of an enumeration type can be declared implicitly by assigning one of the symbolic constants to it. By convention, each of the symbolic constants starts with the name of the enumeration followed by an underscore. The name of the enumeration is its \texttt{type name}, or \texttt{type}, and the symbolic constants are its possible \texttt{constants}.

\begin{verbatim}
Note
\end{verbatim}

A \texttt{boolean} is a pre-declared enumeration that does not follow the normal naming convention and that has a special role in some pseudocode constructs, such as \texttt{if} statements. This means the enumeration of a \texttt{boolean} is:

\begin{verbatim}
enumeration boolean {FALSE, TRUE};
\end{verbatim}
J9.3.7 Lists

A list is an ordered set of other data items, separated by commas and enclosed in parentheses, for example:

(bits(32) shifter_result, bit shifter_carry_out)

A list always contains at least one data item.

Lists are often used as the return type for a function that returns multiple results. For example, the list at the start of this section is the return type of the function \texttt{Shift\_C()} that performs a standard A32/T32 shift or rotation, when its first operand is of type \texttt{bits(32)}.

Some specific pseudocode operators use lists surrounded by other forms of bracketing than the (..) parentheses. These are:

- Bitstring extraction operators, that use lists of bit numbers or ranges of bit numbers surrounded by angle brackets <…>.
- Array indexing, that uses lists of array indexes surrounded by square brackets [...].
- Array-like function argument passing, that uses lists of function arguments surrounded by square brackets [...].

Each combination of data types in a list is a separate type, with type name given by listing the data types. This means that the example list at the start of this section is of type (\texttt{bits(32)}, \texttt{bit}). The general principle that types can be declared by assignment extends to the types of the individual list items in a list. For example:

\[
\langle \text{shift}_t, \text{shift}_n \rangle = (\text{'00'}, 0);
\]

implicitly declares:

- \text{shift}_t to be of type \texttt{bits(2)}.
- \text{shift}_n to be of type \texttt{integer}.
- \langle \text{shift}_t, \text{shift}_n \rangle to be of type \texttt{(bits(2), integer)}.

A list type can also be explicitly named, with explicitly named elements in the list. For example:

\[
\text{type ShiftSpec is (bits(2) shift, integer amount)};
\]

After this definition and the declaration:

\[
\text{ShiftSpec abc;}
\]

The elements of the resulting list can then be referred to as \texttt{abc.shift} and \texttt{abc.amount}. This qualified naming of list elements is only permitted for variables that have been explicitly declared, not for those that have been declared by assignment only.

Explicitly naming a type does not alter what type it is. For example, after the above definition of \texttt{ShiftSpec}, \texttt{ShiftSpec} and \texttt{(bits(2), integer)} are two different names for the same type, not the names of two different types. To avoid ambiguity in references to list elements, it is an error to declare a list variable multiple times using different names of its type or to qualify it with list element names not associated with the name by which it was declared.

An item in a list that is being assigned to can be written as “-” to indicate that the corresponding item of the assigned list value is discarded. For example:

\[
\langle \text{shifted}, - \rangle = \text{LSL\_C(operand, amount)};
\]

List constants are written as a list of constants of the appropriate types, for example the (\text{'00'}, 0) in the earlier example.
J9.3.8 Arrays

Pseudocode arrays are indexed by either enumerations or integer ranges. An integer range is represented by the lower inclusive end of the range, then ..., then the upper inclusive end of the range.

For example:

```
array bits(64) R[0..30];
```

Arrays are always explicitly declared, and there is no notation for a constant array. Arrays always contain at least one element, because:

- Enumerations always contain at least one symbolic constant.
- Integer ranges always contain at least one integer.

Arrays do not usually appear directly in pseudocode. The items that syntactically look like arrays in pseudocode are usually array-like functions such as \( R[i] \), \( Mem(address, size) \) or \( Elem(vector, i, size) \). These functions package up and abstract additional operations normally performed on accesses to the underlying arrays, such as register banking, memory protection, endian-dependent byte ordering, exclusive-access housekeeping and Advanced SIMD element processing.
### J9.4 Expressions

This section describes:
- **General expression syntax.**
- Operators and functions - polymorphism and prototypes on page J9-5766.
- Precedence rules on page J9-5766.

#### J9.4.1 General expression syntax

An expression is one of the following:
- A constant.
- A variable, optionally preceded by a data type name to declare its type.
- The word `UNKNOWN` preceded by a data type name to declare its type.
- The result of applying a language-defined operator to other expressions.
- The result of applying a function to other expressions.

Variable names normally consist of alphabetic and underscore characters, starting with an alphabetic or underscore character.

Each register described in the text is to be regarded as declaring a correspondingly named bitstring variable, and that variable has the stated behavior of the register. For example, if a bit of a register is defined as RAZ/WI, then the corresponding bit of its variable reads as 0 and ignore writes.

An expression like `bits(32) UNKNOWN` indicates that the result of the expression is a value of the given type, but the architecture does not specify what value it is and software must not rely on such values. The value produced must not:
- Return information that cannot be accessed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE and do not return UNKNOWN values,
- Be promoted as providing any useful information to software.

**Note**

UNKNOWN values are similar to the definition of UNPREDICTABLE, but do not indicate that the entire architectural state becomes unspecified.

Only the following expressions are assignable. This means that these are the only expressions that can be placed on the left-hand side of an assignment.
- Variables.
- The results of applying some operators to other expressions.
  The description of each language-defined operator that can generate an assignable expression specifies the circumstances under which it does so. For example, those circumstances might require that one or more of the expressions the operator operates on is an assignable expression.
- The results of applying array-like functions to other expressions. The description of an array-like function specifies the circumstances under which it can generate an assignable expression.

Every expression has a data type.
- For a constant, this data type is determined by the syntax of the constant.
- For a variable, there are the following possible sources for the data type
  - An optional preceding data type name.
  - A data type the variable was given earlier in the pseudocode by recursive application of this rule.
  - A data type the variable is being given by assignment, either by direct assignment to the variable, or by assignment to a list of which the variable is a member.
It is a pseudocode error if none of these data type sources exists for a variable, or if more than one of them exists and they do not agree about the type.

- For a language-defined operator, the definition of the operator determines the data type.
- For a function, the definition of the function determines the data type.

### J9.4.2 Operators and functions - polymorphism and prototypes

Operators and functions in pseudocode can be polymorphic, producing different functionality when applied to different data types. Each resulting form of an operator or function has a different prototype definition. For example, the operator + has forms that act on various combinations of integers, reals and bitstrings.

One particularly common form of polymorphism is between bitstrings of different lengths. This is represented by using bits(N), bits(M), or similar, in the prototype definition.

### J9.4.3 Precedence rules

The precedence rules for expressions are:

1. Constants, variables and function invocations are evaluated with higher priority than any operators using their results, but see Operations on Booleans on page J9-5767.

2. Expressions on integers follow the normal operator precedence rules of exponentiation before multiply/divide before add/subtract, with sequences of multiply/divides or add/subtracts evaluated left-to-right.

3. Other expressions must be parenthesized to indicate operator precedence if ambiguity is possible, but need not be if all permitted precedence orders under the type rules necessarily lead to the same result. For example, if i, j and k are integer variables, i > 0 && j > 0 && k > 0 is acceptable, but i > 0 && j > 0 || k > 0 is not.
J9.5  Operators and built-in functions

This section describes:

• Operations on generic types.
• Operations on Booleans.
• Bitstring manipulation.
• Arithmetic on page J9-5770.

J9.5.1 Operations on generic types

The following operations are defined for all types.

Equality and non-equality testing

Any two values \( x \) and \( y \) of the same type can be tested for equality by the expression \( x == y \) and for non-equality by the expression \( x != y \). In both cases, the result is of type boolean.

A special form of comparison is defined with a bitstring constant that includes \('x'\) bits as well as \('0'\) and \('1'\) bits. The bits corresponding to the \('x'\) bits are ignored in determining the result of the comparison. For example, if opcode is a 4-bit bitstring, \( \text{opcode} == '1x0x' \), this matches the values \('1000'\), \('1100'\), \('1001'\) and \('1101'\).

Note

This special form is permitted in the implied equality comparisons in when parts of case ... of ... structures.

Conditional selection

If \( x \) and \( y \) are two values of the same type and \( t \) is a value of type boolean, then \( \text{if } t \text{ then } x \text{ else } y \) is an expression of the same type as \( x \) and \( y \) that produces \( x \) if \( t \) is TRUE and \( y \) if \( t \) is FALSE.

J9.5.2 Operations on Booleans

If \( x \) is a boolean, then \( !x \) is its logical inverse.

If \( x \) and \( y \) are booleans, then \( x && y \) is the result of ANDing them together. As in the C language, if \( x \) is FALSE, the result is determined to be FALSE without evaluating \( y \).

If \( x \) and \( y \) are booleans, then \( x || y \) is the result of ORing them together. As in the C language, if \( x \) is TRUE, the result is determined to be TRUE without evaluating \( y \).

Note

If \( x \) and \( y \) are booleans, then the result of \( x != y \) is the same as the result of exclusive-ORing \( x \) and \( y \) together.

J9.5.3 Bitstring manipulation

The following bitstring manipulation functions are defined:

Bitstring length and most significant bit

If \( x \) is a bitstring:

• The bitstring length function \( \text{Len}(x) \) returns the length of \( x \) as an integer.
• \( \text{TopBit}(x) \) is the leftmost bit of \( x \). Using bitstring extraction, this means:
  \[ \text{TopBit}(x) = x<\text{Len}(x)-1> \]
**Bitstring concatenation and replication**

If \( x \) and \( y \) are bitstrings of lengths \( N \) and \( M \) respectively, then \( x:y \) is the bitstring of length \( N+M \) constructed by concatenating \( x \) and \( y \) in left-to-right order.

If \( x \) is a bitstring and \( n \) is an integer with \( n > 0 \):
- \( \text{Replicate}(x, n) \) is the bitstring of length \( n \cdot \text{Len}(x) \) consisting of \( n \) copies of \( x \) concatenated together.
- \( \text{Zeros}(n) = \text{Replicate}('0', n), \text{Ones}(n) = \text{Replicate}('1', n). \)

**Bitstring extraction**

The bitstring extraction operator extracts a bitstring from either another bitstring or an integer. Its syntax is \( x<\text{integer_list}> \), where \( x \) is the integer or bitstring being extracted from, and \( \text{integer_list} \) is a list of integers enclosed in angle brackets rather than the usual parentheses. The length of the resulting bitstring is equal to the number of integers in \( \text{integer_list} \). In \( x<\text{integer_list}> \), each of the integers in \( \text{integer_list} \) must be:
- \( \geq 0 \).
- \( < \text{Len}(x) \) if \( x \) is a bitstring.

The definition of \( x<\text{integer_list}> \) depends on whether \( \text{integer_list} \) contains more than one integer:
- If \( \text{integer_list} \) contains more than one integer, \( x<i, j, k, ..., n> \) is defined to be the concatenation:
  \( x<i> : x<j> : x<k> : ... : x<n> \).
- If \( \text{integer_list} \) consists of just one integer \( i \), \( x<i> \) is defined to be:
  — If \( x \) is a bitstring, '0' if bit \( i \) of \( x \) is a zero and '1' if bit \( i \) of \( x \) is a one.
  — If \( x \) is an integer, let \( y \) be the unique integer in the range 0 to \( 2^{(i+1)}-1 \) that is congruent to \( x \) modulo \( 2^{(i+1)} \). Then \( x<i> \) is '0' if \( y < 2^i \) and '1' if \( y \geq 2^i \).

Loosely, this definition treats an integer as equivalent to a sufficiently long two's complement representation of it as a bitstring.

In \( \text{integer_list} \), the notation \( i:j \) with \( i \geq j \) is shorthand for the integers in order from \( i \) down to \( j \), with both end values included. For example, \( \text{instr}<31:28> \) is shorthand for \( \text{instr}<31, 30, 29, 28> \).

The expression \( x<\text{integer_list}> \) is assignable provided \( x \) is an assignable bitstring and no integer appears more than once in \( \text{integer_list} \). In particular, \( x<i> \) is assignable if \( x \) is an assignable bitstring and \( 0 \leq i < \text{Len}(x) \).

Encoding diagrams for registers frequently show named bits or multi-bit fields. For example, the encoding diagram for the APSR shows its bit<31> as N. In such cases, the syntax \( \text{APSR}.N \) is used as a more readable synonym for \( \text{APSR}<31> \).

**Logical operations on bitstrings**

If \( x \) is a bitstring, \( \text{NOT}(x) \) is the bitstring of the same length obtained by logically inverting every bit of \( x \).

If \( x \) and \( y \) are bitstrings of the same length, \( x \text{ AND } y \), \( x \text{ OR } y \), and \( x \text{ EOR } y \) are the bitstrings of that same length obtained by logically ANDing, ORing, and exclusive-ORing corresponding bits of \( x \) and \( y \) together.

**Bitstring count**

If \( x \) is a bitstring, \( \text{BitCount}(x) \) produces an integer result equal to the number of bits of \( x \) that are ones.
Testing a bitstring for being all zero or all ones

If \( x \) is a bitstring:
- \( \text{IsZero}(x) \) produces TRUE if all of the bits of \( x \) are zeros and FALSE if any of them are ones
- \( \text{IsZeroBit}(x) \) produces '1' if all of the bits of \( x \) are zeros and '0' if any of them are ones.

\( \text{IsOnes}(x) \) and \( \text{IsOnesBit}(x) \) work in the corresponding ways. This means:

\[
\begin{align*}
\text{IsZero}(x) &= (\text{BitCount}(x) == 0) \\
\text{IsOnes}(x) &= (\text{BitCount}(x) == \text{Len}(x)) \\
\text{IsZeroBit}(x) &= \text{if IsZero}(x) \text{ then '1' else '0'} \\
\text{IsOnesBit}(x) &= \text{if IsOnes}(x) \text{ then '1' else '0'}
\end{align*}
\]

Lowest and highest set bits of a bitstring

If \( x \) is a bitstring, and \( N = \text{Len}(x) \):
- \( \text{LowestSetBit}(x) \) is the minimum bit number of any of its bits that are ones. If all of its bits are zeros, \( \text{LowestSetBit}(x) = N \).
- \( \text{HighestSetBit}(x) \) is the maximum bit number of any of its bits that are ones. If all of its bits are zeros, \( \text{HighestSetBit}(x) = -1 \).
- \( \text{CountLeadingZeroBits}(x) \) is the number of zero bits at the left end of \( x \), in the range 0 to \( N \). This means:
  \( \text{CountLeadingZeroBits}(x) = N - 1 - \text{HighestSetBit}(x) \).
- \( \text{CountLeadingSignBits}(x) \) is the number of copies of the sign bit of \( x \) at the left end of \( x \), excluding the sign bit itself, and is in the range 0 to \( N-1 \). This means:
  \( \text{CountLeadingSignBits}(x) = \text{CountLeadingZeroBits}(x <N-1:1> \text{ EOR } x <N-2:0>) \).

Zero-extension and sign-extension of bitstrings

If \( x \) is a bitstring and \( i \) is an integer, then \( \text{ZeroExtend}(x, i) \) is \( x \) extended to a length of \( i \) bits, by adding sufficient zero bits to its left. That is, if \( i = \text{Len}(x) \), then \( \text{ZeroExtend}(x, i) = x \), and if \( i > \text{Len}(x) \), then:

\[
\text{ZeroExtend}(x, i) = \text{Replicate('0', i-Len(x)) : x}
\]

If \( x \) is a bitstring and \( i \) is an integer, then \( \text{SignExtend}(x, i) \) is \( x \) extended to a length of \( i \) bits, by adding sufficient copies of its leftmost bit to its left. That is, if \( i = \text{Len}(x) \), then \( \text{SignExtend}(x, i) = x \), and if \( i > \text{Len}(x) \), then:

\[
\text{SignExtend}(x, i) = \text{Replicate(TopBit(x), i-Len(x)) : x}
\]

It is a pseudocode error to use either \( \text{ZeroExtend}(x, i) \) or \( \text{SignExtend}(x, i) \) in a context where it is possible that \( i < \text{Len}(x) \).

Converting bitstrings to integers

If \( x \) is a bitstring, \( \text{SInt}(x) \) is the integer whose two's complement representation is \( x \):

\[
\begin{align*}
\text{// SInt()} \\
\text{// ======} \\
\text{integer SInt(bits(N) x) } \\
\text{result} = 0; \\
\text{for } i = 0 \text{ to } N-1 \\
\text{if } x<i> == '1' \text{ then result} = \text{result} + 2^i; \\
\text{if } x<N-1> == '1' \text{ then result} = \text{result} - 2^N; \\
\text{return result;}
\end{align*}
\]

\( \text{UInt}(x) \) is the integer whose unsigned representation is \( x \):

\[
\begin{align*}
\text{// UInt()} \\
\text{// ======}
\end{align*}
\]
J9.5.4 Arithmetic

Most pseudocode arithmetic is performed on integer or real values, with operands being obtained by conversions from bitstrings and results converted back to bitstrings afterwards. As these data types are the unbounded mathematical types, no issues arise about overflow or similar errors.

Unary plus, minus and absolute value

If \( x \) is an integer or real, then \( +x \) is \( x \) unchanged, \( -x \) is \( x \) with its sign reversed, and \( \text{Abs}(x) \) is the absolute value of \( x \). All three are of the same type as \( x \).

Addition and subtraction

If \( x \) and \( y \) are integers or reals, \( x+y \) and \( x-y \) are their sum and difference. Both are of type integer if \( x \) and \( y \) are both of type integer, and real otherwise.

Addition and subtraction are particularly common arithmetic operations in pseudocode, and so it is also convenient to have definitions of addition and subtraction acting directly on bitstring operands.

If \( x \) and \( y \) are bitstrings of the same length \( N \), so that \( N = \text{Len}(x) = \text{Len}(y) \), then \( x+y \) and \( x-y \) are the least significant \( N \) bits of the results of converting them to integers and adding or subtracting them. Signed and unsigned conversions produce the same result:

\[
\begin{align*}
\text{Int}(x, \text{unsigned}) & = \text{Int}(x, \text{unsigned}) < N-1:0 > \\
& = (\text{UInt}(x) + \text{UInt}(y)) < N-1:0 > \\
\text{Int}(x, \text{unsigned}) & = \text{Int}(x, \text{unsigned}) < N-1:0 > \\
& = (\text{UInt}(x) - \text{UInt}(y)) < N-1:0 > \\
\text{Int}(x, \text{unsigned}) & = \text{Int}(x, \text{unsigned}) < N-1:0 > \\
\text{Int}(x, \text{unsigned}) & = \text{Int}(x, \text{unsigned}) < N-1:0 >
\end{align*}
\]

If \( x \) is a bitstring of length \( N \) and \( y \) is an integer, \( x+y \) and \( x-y \) are the bitstrings of length \( N \) defined by \( x+y = x + y < N-1:0 > \) and \( x-y = x - y < N-1:0 > \). Similarly, if \( x \) is an integer and \( y \) is a bitstring of length \( M \), \( x+y \) and \( x-y \) are the bitstrings of length \( M \) defined by \( x+y = x < M-1:0 > + y \) and \( x-y = x < M-1:0 > - y \).

Comparisons

If \( x \) and \( y \) are integers or reals, then \( x == y \), \( x != y \), \( x < y \), \( x <= y \), \( x > y \), and \( x >= y \) are equal, not equal, less than, less than or equal, greater than, and greater than or equal comparisons between them, producing Boolean results. In the case of \( == \) and \( != \), this extends the generic definition applying to any two values of the same type to also act between integers and reals.

Multiplication

If \( x \) and \( y \) are integers or reals, then \( x \times y \) is the product of \( x \) and \( y \). It is of type integer if \( x \) and \( y \) are both of type integer, and real otherwise.
Division and modulo

If \( x \) and \( y \) are integers or reals, then \( x/y \) is the result of dividing \( x \) by \( y \), and is always of type \( \text{real} \).

If \( x \) and \( y \) are integers, then \( x \text{ DIV } y \) and \( x \text{ MOD } y \) are defined by:

\[
\begin{align*}
    x \text{ DIV } y &= \text{RoundDown}(x/y) \\
    x \text{ MOD } y &= x - y \times (x \text{ DIV } y)
\end{align*}
\]

It is a pseudocode error to use any of \( x/y \), \( x \text{ MOD } y \), or \( x \text{ DIV } y \) in any context where \( y \) can be zero.

Square root

If \( x \) is an integer or a real, \( \text{Sqrt}(x) \) is its square root, and is always of type \( \text{real} \).

Rounding and aligning

If \( x \) is a real:

- \( \text{RoundDown}(x) \) produces the largest integer \( n \) such that \( n \leq x \).
- \( \text{RoundUp}(x) \) produces the smallest integer \( n \) such that \( n \geq x \).
- \( \text{RoundTowardsZero}(x) \) produces \( \text{RoundDown}(x) \) if \( x > 0.0 \), \( 0 \) if \( x == 0.0 \), and \( \text{RoundUp}(x) \) if \( x < 0.0 \).

If \( x \) and \( y \) are both of type \( \text{integer} \), \( \text{Align}(x, y) = y \times (x \text{ DIV } y) \) is of type \( \text{integer} \).

If \( x \) is of type \( \text{bitstring} \) and \( y \) is of type \( \text{integer} \), \( \text{Align}(x, y) = (\text{Align}(\text{UInt}(x), y)) < \text{Len}(x)-1:0> \) is a \( \text{bitstring} \) of the same length as \( x \).

It is a pseudocode error to use either form of \( \text{Align}(x, y) \) in any context where \( y \) can be 0. In practice, \( \text{Align}(x, y) \) is only used with \( y \) a constant power of two, and the bitstring form used with \( y = 2^n \) has the effect of producing its argument with its \( n \) low-order bits forced to zero.

Scaling

If \( x \) and \( n \) are of type \( \text{integer} \), then:

- \( x \ll n = \text{RoundDown}(x \times 2^n) \).
- \( x \gg n = \text{RoundDown}(x \times 2^{(-n)}) \).

Maximum and minimum

If \( x \) and \( y \) are integers or reals, then \( \text{Max}(x, y) \) and \( \text{Min}(x, y) \) are their maximum and minimum respectively. Both are of type \( \text{integer} \) if \( x \) and \( y \) are both of type \( \text{integer} \), and \( \text{real} \) otherwise.

Raising to a power

If \( x \) is an integer or a real and \( n \) is an integer then \( x^n \) is the result of raising \( x \) to the power of \( n \), and:

- If \( x \) is of type \( \text{integer} \) then \( x^n \) is of type \( \text{integer} \).
- If \( x \) is of type \( \text{real} \) then \( x^n \) is of type \( \text{real} \).
J9.6 Statements and program structure

This section describes the control statements used in the pseudocode.

J9.6.1 Simple statements

Each of the following simple statements must be terminated with a semicolon, as shown.

**Assignments**

An assignment statement takes the form:

```
<assignable_expression> = <expression>;
```

**Procedure calls**

A procedure call takes the form:

```
<procedure_name>(<arguments>);
```

**Return statements**

A procedure return takes the form:

```
return;
```

And a function return takes the form:

```
return <expression>;
```

where `<expression>` is of the type declared in the function prototype line.

**UNDEFINED**

This subsection describes the statement:

```
UNDEFINED;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is that the Undefined Instruction exception is taken.

**UNPREDICTABLE**

This subsection describes the statement:

```
UNPREDICTABLE;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is `UNPREDICTABLE`.

**SEE...**

This subsection describes the statement:

```
SEE <reference>;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is that nothing occurs as a result of the current pseudocode because some other piece of pseudocode defines the required behavior. The `<reference>` indicates where that other pseudocode can be found.

It usually refers to another instruction, but can also refer to another encoding or note of the same instruction.
IMPLEMENTATION_DEFINED

This subsection describes the statement:

IMPLEMENTATION_DEFINED {<text>};

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is IMPLEMENTATION_DEFINED. An optional <text> field can give more information.

J9.6.2 Compound statements

Indentation normally indicates the structure in compound statements. The statements contained in structures such as if ... then ... else ... or procedure and function definitions are indented more deeply than the statement itself, and their end is indicated by returning to the original indentation level or less.

Indentation is normally done by four spaces for each level.

if ... then ... else ...

A multi-line if ... then ... else ... structure takes the form:

if <boolean_expression> then
  <statement 1>
  <statement 2>
  ...
  <statement n>
elsif <boolean_expression> then
  <statement a>
  <statement b>
  ...
  <statement z>
else
  <statement A>
  <statement B>
  ...
  <statement Z>

The block of lines consisting of elsif and its indented statements is optional, and multiple elseif blocks can be used.

The block of lines consisting of else and its indented statements is optional.

Abbreviated one-line forms can be used when there are only simple statements in the then part and in the else part, if it is present, such as:

if <boolean_expression> then <statement 1>
if <boolean_expression> then <statement 1> else <statement A>
if <boolean_expression> then <statement 1> <statement 2> else <statement A>

Note

In these forms, <statement 1>, <statement 2> and <statement A> must be terminated by semicolons. This and the fact that the else part is optional are differences from the if ... then ... else ... expression.
repeat ... until ...

A repeat ... until ... structure takes the form:

repeat
  <statement 1>
  <statement 2>
  ...
  <statement n>
until <boolean_expression>;

while ... do

A while ... do structure takes the form:

while <boolean_expression> do
  <statement 1>
  <statement 2>
  ...
  <statement n>

for ...

A for ... structure takes the form:

for <assignable_expression> = <integer_expr1> to <integer_expr2>
  <statement 1>
  <statement 2>
  ...
  <statement n>

case ... of ...

A case ... of ... structure takes the form:

case <expression> of
  when <constant values>
    <statement 1>
    <statement 2>
    ...
    <statement n>
  ... more "when" groups ...
  otherwise
    <statement A>
    <statement B>
    ...
    <statement Z>

In this structure, <constant values> consists of one or more constant values of the same type as <expression>, separated by commas. Abbreviated one line forms of when and otherwise parts can be used when they contain only simple statements.

If <expression> has a bitstring type, <constant values> can also include bitstring constants containing 'x' bits. For details see Equality and non-equality testing on page J9-5767.
Procedure and function definitions

A procedure definition takes the form:

```
<procedure name>(<argument prototypes>)
    <statement 1>
    <statement 2>
    ...
    <statement n>
```

where `<argument prototypes>` consists of zero or more argument definitions, separated by commas. Each argument definition consists of a type name followed by the name of the argument.

--- Note ---
This first prototype line is not terminated by a semicolon. This helps to distinguish it from a procedure call.

A function definition is similar, but also declares the return type of the function:

```
<return type> <function name>(<argument prototypes>)
    <statement 1>
    <statement 2>
    ...
    <statement n>
```

An array-like function is similar, but with square brackets:

```
<return type> <function name>[<argument prototypes>]
    <statement 1>
    <statement 2>
    ...
    <statement n>
```

An array-like function also usually has an assignment prototype:

```
<function name>[<argument prototypes>] = <value prototypes>
    <statement 1>
    <statement 2>
    ...
    <statement n>
```

J9.6.3 Comments

Two styles of pseudocode comment exist:

- `//` starts a comment that is terminated by the end of the line.
- `/*` starts a comment that is terminated by `*/`. 
J9.7 Miscellaneous helper procedures and functions

The functions described in this section are not part of the pseudocode specification. They are miscellaneous helper procedures and functions used by pseudocode that are not described elsewhere in this manual. Each has a brief description and a pseudocode prototype, except that the prototype is omitted where it is identical to the section title.

J9.7.1 ArchVersion()

This function returns the major version number of the architecture.

// ArchVersion()
// =============
integer ArchVersion()
return 8;

J9.7.2 EndOfInstruction()

This procedure terminates processing of the current instruction.

EndOfInstruction();

J9.7.3 GenerateAlignmentException()

This procedure generates the appropriate exception for an alignment error.

In this manual, GenerateAlignmentException() generates a Data Abort exception.

J9.7.4 Hint_Debug()

This procedure supplies a hint to the debug system.

Hint_Debug(bits(4) option);

J9.7.5 Hint_PreloadData()

This procedure performs a preload data hint.

Hint_PreloadData(bits(32) address);

J9.7.6 Hint_PreloadDataForWrite()

This procedure performs a preload data hint with a probability that the use will be for a write.

Hint_PreloadDataForWrite(bits(32) address);

J9.7.7 Hint_PreloadInstr()

This procedure performs a preload instructions hint.

Hint_PreloadInstr(bits(32) address);

J9.7.8 Hint_Yield()

This procedure performs a Yield hint.

Hint_Yield();

J9.7.9 IntegerZeroDivideTrappingEnabled()

This function returns TRUE if the trapping of divisions by zero in the integer division instructions SDIV and UDIV is enabled, and FALSE otherwise.
The A32 and T32 SDIV and UDIV implementation does not support trapping of integer division by zero and therefore this function always returns FALSE.

```c
boolean IntegerZeroDivideTrappingEnabled();
```

### J9.7.10 IsExternalAbort()

This function returns TRUE if the abort currently being processed is an external abort and FALSE otherwise. It is used only in exception entry pseudocode.

```c
boolean IsExternalAbort(Fault type)
assert type != Fault_None;
```

```c
boolean IsExternalAbort(FaultRecord fault);
```

### J9.7.11 IsAsyncAbort()

This function returns TRUE if the abort currently being processed is an asynchronous abort, and FALSE otherwise. It is used only in exception entry pseudocode.

```c
boolean IsAsyncAbort(Fault type)
assert type != Fault_None;
```

```c
boolean IsAsyncAbort(FaultRecord fault);
```

### J9.7.12 LSInstructionSyndrome()

This function returns the extended syndrome information for a fault reported in the HSR.

```c
bits(11) LSInstructionSyndrome();
```

### J9.7.13 ProcessorID()

This function returns an integer that uniquely identifies the executing PE in the system.

```c
integer ProcessorID();
```

### J9.7.14 RemapRegsHaveResetValues()

This function returns TRUE if the remap registers PRRR and NMRR have their IMPLEMENTATION DEFINED reset values, and FALSE otherwise.

```c
boolean RemapRegsHaveResetValues();
```

### J9.7.15 ThisInstr()

This function returns the bitstring encoding of the currently-executing instruction.

```c
bits(32) ThisInstr();
```

Note: Currently, this function is used only on 32-bit instruction encodings.

### J9.7.16 ThisInstrLength()

This function returns the length, in bits, of the current instruction. This means it returns 32 or 16:

```c
integer ThisInstrLength();
```
Appendix J9 ARM Pseudocode Definition

Appendix J11
Registers Index

This appendix provides indexes to the register descriptions in this manual. It contains the following sections:

- Introduction and register disambiguation on page J11-5816.
- Alphabetical index of AArch64 registers and system instructions on page J11-5820.
- Functional index of AArch64 registers and system instructions on page J11-5829.
- Alphabetical index of AArch32 registers and system instructions on page J11-5841.
- Functional index of AArch32 registers and system instructions on page J11-5850.
- Alphabetical index of memory-mapped registers on page J11-5861.
- Functional index of memory-mapped registers on page J11-5866.
J11.1 Introduction and register disambiguation

In some sections of this manual, registers are referred to by a general name, where the description applies to more than one context. Generally, this is one of the following:

- The description applies to both AArch32 state and AArch64 state, and therefore the register names could apply to either AArch32 system registers or AArch64 system registers.

- The description applies to multiple Exception levels, and therefore at a particular Exception level the register names need to take the appropriate Exception. level suffix, _EL0, _EL1, _EL2, or _EL3.

The following sections disambiguate the general register names:

- Register name disambiguation by Execution state.
- Register name disambiguation by Exception level on page J11-5819.

J11.1.1 Register name disambiguation by Execution state

Table J11-1 disambiguates the general names of the registers by Execution state.

Note
The update of the Glossary from ARMv7 to ARMv8 has been started but remains work-in-progress.

A32 instruction
A word that specifies an operation to be performed by a PE that is executing in an Exception level that is using AArch32 and is in A32 state. A32 instructions must be word-aligned.

A32 instructions were previously called ARM instructions.

See also A32 state, A64 instruction, T32 instruction.

A32 state
The AArch32 Instruction set state in which the PE executes A32 instructions.

A32 state was previously called ARM state.

See also T32 instruction, T32 state.

A64 instruction
A word that specifies an operation to be performed by a PE that is executing in an Exception level that is using AArch64. A64 instructions must be word-aligned.

See also A32 instruction, T32 instruction.

AArch32
The 32-bit Execution state. In AArch32 state, addresses are held in 32-bit registers, and instructions in the base instruction sets use 32-bit registers for their processing. AArch32 state supports the T32 and A32 instruction sets.

See also AArch64, A32 instruction, T32 instruction.

AArch64
The 64-bit Execution state. In AArch64 state, addresses are held in 64-bit registers, and instructions in the base instruction set can use 64-bit registers for their processing. AArch64 state supports the A64 instruction set.

See also AArch32, A64 instruction.
Abort  An exception caused by an illegal memory access. Aborts can be caused by the external memory system or the MMU.

Addressing mode  Means a method for generating the memory address used by a load/store instruction.

Advanced SIMD  A feature of the ARM architecture that provides SIMD operations on a register file of SIMD and floating-point registers. Where an implementation supports both Advanced SIMD and floating-point instructions, these instructions operate on the same register file.

Aligned  A data item stored at an address that is divisible by the highest power of 2 that divides into its size in bytes. Aligned halfwords, words and doublewords therefore have addresses that are divisible by 2, 4 and 8 respectively.

An aligned access is one where the address of the access is aligned to the size of each element of the access.

Architecturally executed  An instruction is architecturally executed only if it would be executed in a simple sequential execution of the program. When such an instruction has been executed and retired it has been architecturally executed. Any instruction that, in a simple sequential execution of a program, is treated as a NOP because it fails its condition code check, is an architecturally executed instruction.

In a PE that performs speculative execution, an instruction is not architecturally executed if the PE discards the results of a speculative execution.

See also Condition code check, Simple sequential execution.

Architecturally mapped  Where this manual describes a register as being architecturally mapped to another register, this indicates that, in an implementation that supports both of the registers, the two registers access the same state.

ARM core registers  Some older documentation uses ARM core registers to refer to the following set of registers for execution in AArch32 state:

- The thirteen general-purpose registers, R0-R12, that software can use for processing.
- SP, the stack pointer, that can also be referred to as R13.
- LR, the link register, that can also be referred to as R14.
- PC, the program counter, that can also be referred to as R15.

See also General-purpose registers.

ARM instruction  See A32 instruction.

Associativity  See Cache associativity.

Atomicity  Describes either single-copy atomicity or multi-copy atomicity. Atomicity in the ARM architecture on page B2-81 defines these forms of atomicity for the ARM architecture.

See also Multi-copy atomicity, Single-copy atomicity.

Banked register  A register that has multiple instances, with the instance that is in use depending on the PE mode, Security state, or other PE state.

Base register  A register specified by a load/store instruction that is used as the base value for the address calculation for the instruction. Depending on the instruction and its addressing mode, an offset can be added to or subtracted from the base register value to form the virtual address that is sent to memory.

Base register writeback  Describes writing back a modified value to the base register used in an address calculation.
Behaves as if
Where this manual indicates that a PE behaves as if a certain condition applies, all descriptions of the operation of the PE must be re-evaluated taking account of that condition, together with any other conditions that affect operation.

Big-endian memory
Means that, for example:
- A byte or halfword at a word-aligned address is the most significant byte or halfword in the word at that address.
- A byte at a halfword-aligned address is the most significant byte in the halfword at that address.

Blocking
Describes an operation that does not permit following instructions to be executed before the operation completes. A non-blocking operation can permit following instructions to be executed before the operation completes, and in the event of encountering an exception does not signal an exception to the PE. This enables implementations to retire following instructions while the non-blocking operation is executing, without the need to retain precise PE state.

Branch prediction
Is where a PE selects a future execution path to fetch along. For example, after a branch instruction, the PE can choose to speculatively fetch either the instruction following the branch or the instruction at the branch target. See also Prefetching.

Breakpoint
A debug event triggered by the execution of a particular instruction, specified by one or both of the address of the instruction and the state of the PE when the instruction is executed.

Byte
An 8-bit data item.

Cache associativity
The number of locations in a cache set to which an address can be assigned. Each location is identified by its way value.

Cache level
The position of a cache in the cache hierarchy. In the ARM architecture, the lower numbered levels are those closest to the PE. For more information see Terms used in describing the maintenance instructions on page D3-1696.

Cache line
The basic unit of storage in a cache. Its size in words is always a power of two, usually 4 or 8 words. A cache line must be aligned to a suitable memory boundary. A memory cache line is a block of memory locations with the same size and alignment as a cache line. Memory cache lines are sometimes loosely called cache lines.

Cache lockdown
Enables critical software and data to be loaded into the cache so that the cache lines containing them are not subsequently reallocated. It alleviates the delays caused by accessing a cache in a worst-case situation. This ensures that all subsequent accesses to the software and data concerned are cache hits and so complete quickly.

Cache miss
A memory access that cannot be processed at high speed because the data it addresses is not in the cache.

Cache sets
Areas of a cache, divided up to simplify and speed up the process of determining whether a cache hit occurs. The number of cache sets is always a power of two.

Cache way
A cache way consists of one cache line from each cache set. The cache ways are indexed from 0 to (Associativity-1). Each cache line in a cache way is chosen to have the same index as the cache way. For example, cache way n consists of the cache line with index n from each cache set.

Coherence order
See Coherent.

Coherent
Data accesses from a set of observers to a byte in memory are coherent if accesses to that byte in memory by the members of that set of observers are consistent with there being a single total order of all writes to that byte in memory by all members of the set of observers. This single total order of all to writes to that memory location is the coherence order for that byte in memory.
Condition code check
The process of determining whether a conditional instruction executes normally or is treated as a NOP. For an instruction that includes a condition code field, that field is compared with the condition flags to determine whether the instruction is executed normally. For a T32 instruction in an IT block, the value of PSTATE.IT determines whether the instruction is executed normally.

See also Condition code field, Condition flags, Conditional execution.

Condition code field
A 4-bit field in an instruction that specifies the condition under which the instruction executes.

See also Condition code check.

Condition flags
The N, Z, C, and V bits of PSTATE, an SPSR, or FPSCR. See the register descriptions for more information.

See also Condition code check, PSTATE.

Conditional execution
When a conditional instruction starts executing, if the condition code check returns TRUE, the instruction executes normally. Otherwise, it is treated as a NOP.

See also Condition code check.

CONSTRAINED UNPREDICTABLE
Where an instruction can result in UNPREDICTABLE behavior, the ARMv8 architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

In body text, the term CONSTRAINED UNPREDICTABLE is shown in SMALL CAPITALS.

See also UNPREDICTABLE.

Context switch
The saving and restoring of computational state when switching between different threads or processes. In this manual, the term context switch describes any situation where the context is switched by an operating system and might or might not include changes to the address space.

Context synchronization operation
One of:
• Performing an ISB operation. An ISB operation is performed when an ISB instruction is executed and does not fail its condition code check.
• Taking an exception.
• Returning from an exception.
• Exit from Debug state.
• Executing a DCPS instruction.
• Executing a DRPS instruction.

The architecture requires a context synchronization operation to guarantee visibility of any change to a System register.

Debugger
In most of this manual, debugger refers to any agent that is performing debug. However, some parts of the manual require a more rigorous definition, and define debugger locally. See:
• Definition of a debugger on page D2-1622 for the definition that applies to Chapter D2.
• Definition of a debugger on page G2-3954 for the definition that applies to Chapter G2.
• Definition of a debugger on page H1-4972 for the definition that applies to Part H.

Deprecated
Something that is present in the ARM architecture for backwards compatibility. Whenever possible software must avoid using deprecated features. Features that are deprecated but are not optional are present in current implementations of the ARM architecture, but might not be present, or might be deprecated and OPTIONAL, in future versions of the ARM architecture.

See also OPTIONAL.
Digital signal processing (DSP)
Algorithms for processing signals that have been sampled and converted to digital form. DSP algorithms often use saturated arithmetic.

Direct Memory Access (DMA)
An operation that accesses main memory directly, without the PE performing any accesses to the data concerned.

Direct read
A direct read of a System register is a read performed by a System register access instruction. For more information see Direct read on page D7-1904. See also Direct write, Indirect read, Indirect write.

Direct write
A direct write of a System register is a write performed by a System register access instruction. For more information see Direct write on page D7-1904. See also Direct read, Indirect read, Indirect write.

DMA
See Direct Memory Access (DMA).

DNM
See Do-Not-Modify (DNM).

Domain
In the ARM architecture, domain is used in the following contexts.

Shareability domain
Defines a set of observers for which the shareability attributes make the data or unified caches transparent for data accesses.

Power domain
Defines a block of logic with a single, common, power supply.

Memory regions domain
When using the Short-descriptor translation table format, defines a collection of Sections, Large pages and Small pages of memory, that can have their access permissions switched rapidly by writing to the Domain Access Control Register (DACR). ARM deprecates any use of memory regions domains.

Do-Not-Modify (DNM)
Means the value must not be altered by software. DNM fields read as UNKNOWN values, and must only be written with the value read from the same field on the same PE.

Double-precision value
Consists of two consecutive 32-bit words that are interpreted as a basic double-precision floating-point number according to the IEEE 754 standard.

Doubleword
A 64-bit data item. Doublewords are normally at least word-aligned in ARM systems.

Doubleword-aligned
Means that the address is divisible by 8.

DSP
See Digital signal processing (DSP).

Endianness
An aspect of the system memory mapping. See also Big-endian memory and Little-endian memory.

Exception
Handles an event. For example, an exception could handle an external interrupt or an undefined instruction.

Exception vector
A fixed address that contains the address of the first instruction of the corresponding exception handler.

Execution stream
The stream of instructions that would have been executed by sequential execution of the program.

Explicit access
A read from memory, or a write to memory, generated by a load or store instruction executed by the PE. Reads and writes generated by hardware translation table accesses are not explicit accesses.

External abort
An abort that is generated by the external memory system.
Fast Context Switch Extension (FCSE)
Modifies the behavior of an ARM memory system to enable multiple programs running on the ARM PE to use identical address ranges, while ensuring that the addresses they present to the rest of the memory system differ. From ARMv6, ARM deprecates any use of the FCSE. The FCSE is:
• Optional in an ARMv7 implementation that does not include the Multiprocessing Extensions.
• Obsolete from the introduction of the Multiprocessing Extensions.

FCSE
See Fast Context Switch Extension (FCSE).

Flat address mapping
Is where the physical address for every access is equal to its virtual address.

Flush-to-zero mode
A special processing mode that optimizes the performance of some floating-point algorithms by replacing the denormalized operands and intermediate results with zeros, without significantly affecting the accuracy of their final results.

General-purpose registers
The registers that the base instructions use for processing:
• In AArch32 state the general-purpose registers are R0-R14, that can also be described as R0-R12, SP, LR.
  
  Note

  Older documentation defines the AArch32 general-purpose registers as R0-R12, and the ARM core registers as R0-R12, SP, LR, and PC.

• In AArch64 state the general-purpose registers are:
  — W0-W30 when accessed as 32-bit registers.
  — X0-X30 when accessed as 64-bit registers.

See also High registers, Low registers.

Halfword
A 16-bit data item. Halfwords are normally halfword-aligned in ARM systems.

Halfword-aligned
Means that the address is divisible by 2.

High registers
In AArch32 state, the general-purpose registers R8-R14. Most 16-bit T32 instructions cannot access the high registers.

  Note

  In some contexts, high registers refers to R8-R15, meaning R8-R14 and the PC.

See also General-purpose registers, Low registers.

High vectors
An alternative location for the exception vectors. The high vector address range is near the top of the address space, rather than at the bottom.

IGNORED
Indicates that the architecture guarantees that the bit or field is not interpreted or modified by hardware.

In body text, the term IGNORED is shown in SMALL CAPITALS.

Immediate and offset fields
Are unsigned unless otherwise stated.

Immediate value
A value that is encoded directly in the instruction and used as numeric data when the instruction is executed. Many A64, A32, and T32 instructions can be used with an immediate argument.

IMP
An abbreviation used in diagrams to indicate that one or more bits have IMPLEMENTATION DEFINED behavior.
IMPLEMENTATION DEFINED
Means that the behavior is not architecturally defined, but must be defined and documented by individual implementations.
In body text, the term IMPLEMENTATION DEFINED is shown in SMALL CAPITALS.

Index register
A register specified in some load and store instructions. The value of this register is used as an offset to be added to or subtracted from the base register value to form the virtual address that is sent to memory. Some instruction forms permit the index register value to be shifted before the addition or subtraction.

Indirect read
When an instruction uses a System register value to establish operating conditions, that use of the System register is an indirect read of the System register.
For more information, including additional examples of indirect reads, see Indirect read on page D7-1904.
See also Direct read, Direct write, Indirect write.

Indirect write
An indirect write of a System register occurs when the contents of a register are updated by some mechanism other than a Direct write to that register. For example, an indirect write to a register might occur as a side-effect of executing an instruction that does not perform a direct write to the register, or because of some operation performed by an external agent.
For more information see Indirect write on page D7-1904.
See also Direct read, Direct write, Indirect read.

Inline literals
These are constant addresses and other data items held in the same area as the software itself. They are automatically generated by compilers, and can also appear in assembler code.

Intermediate Physical Address (IPA)
An implementation of virtualization, the address to which an Guest OS maps a VA. A hypervisor might then map the IPA to a PA. Typically, the Guest OS is unaware of the translation from IPA to PA.
See also Physical address (PA), Virtual address (VA).

Interworking
A method of working that permits branches between software using the A32 and T32 instruction sets.

IPA
See Intermediate Physical Address (IPA).

Level
See Cache level.

Level of Coherence (LoC)
The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of coherency.
For more information see Terms used in describing the maintenance instructions on page D3-1696.
See also Cache level, Point of coherency (PoC).

Level of Unification, Inner Shareable (LoUIS)
The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for the Inner Shareable shareability domain. For more information see Terms used in describing the maintenance instructions on page D3-1696.
See also Cache level, Point of unification (PoU).

Level of Unification, uniprocessor (LoUU)
For a PE, the last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for that PE. For more information see Terms used in describing the maintenance instructions on page D3-1696.
See also Cache level, Point of unification (PoU).

Line
See Cache line.

Little-endian memory
Means that:
• A byte or halfword at a word-aligned address is the least significant byte or halfword in the word at that address.
• A byte at a halfword-aligned address is the least significant byte in the halfword at that address.

**Load/Store architecture**
An architecture where data-processing operations only operate on register contents, not directly on memory contents.

**LoC**  
See **Level of Coherence (LoC)**.

**LoUIS**  
See **Level of Unification, Inner Shareable (LoUIS)**.

**LoUU**  
See **Level of Unification, uniprocessor (LoUU)**.

**Lockdown**  
See **Cache lockdown**.

**Low registers**  
In AArch32 state, general-purpose registers R0-R7. Unlike the high registers, all T32 instructions can access the Low registers.  
*See also* General-purpose registers, High registers.

**Memory barrier**  
See **Memory barriers on page B2-87**.

**Memory coherency**  
The problem of ensuring that when a memory location is read, either by a data read or an instruction fetch, the value actually obtained is always the value that was most recently written to the location. This can be difficult when there are multiple possible physical locations, such as main memory and at least one of a write buffer and one or more levels of cache.

**Memory Management Unit (MMU)**  
Provides detailed control of the part of a memory system that provides a single stage of address translation. Most of the control is provided using translation tables that are held in memory, and define the attributes of different regions of the physical memory map.

**Memory Protection Unit (MPU)**  
A hardware unit whose registers provide simple control of a limited number of protection regions in memory.

**Miss**  
See **Cache miss**.

**MMU**  
See **Memory Management Unit (MMU)**.

**MPU**  
See **Memory Protection Unit (MPU)**.

**Multi-copy atomicity**  
The form of atomicity described in **Requirements for multi-copy atomicity on page B2-82**.  
*See also* Atomicity, Single-copy atomicity.

**NaN**  
Special floating-point values that can be used when neither a numeric value nor an infinity is appropriate. NaNs can be **quiet** NaNs that propagate through most floating-point operations, or **signaling** NaNs that cause Invalid Operation floating-point exceptions when used. For more information, see the IEEE 754 standard.

**Natural eviction**  
A natural eviction is an eviction that occurs in the course of the normal operation of the memory system, rather than because of an operation that explicitly causes an eviction from the cache, such as a cache maintenance operation. Typically, a natural eviction occurs when the caching algorithm requires data to be cached but the cache does not have room for that data.

**Observer**  
A PE or mechanism in the system, such as a peripheral device, that can generate reads from or writes to memory.

**Obsolete**  
Obsolete indicates something that is no longer supported by ARM. When an architectural feature is described as obsolete, this indicates that the architecture has no support for that feature, although an earlier version of the architecture did support it.

**Offset addressing**  
Means that the memory address is formed by adding or subtracting an offset to or from the base register value.
OPTIONAL

When applied to a feature of the architecture, **OPTIONAL** indicates a feature that is not required in an implementation of the ARM architecture:

- If a feature is **OPTIONAL** and deprecated, this indicates that the feature is being phased out of the architecture. ARM expects such a feature to be included in a new implementation only if there is a known backwards-compatibility reason for the inclusion of the feature. A feature that is **OPTIONAL** and deprecated might not be present in future versions of the architecture.
- A feature that is **OPTIONAL** but not deprecated is, typically, a feature added to a version of the ARM architecture after the initial release of that version of the architecture. ARM recommends that such features are included in all new implementations of the architecture.

In body text, these meanings of the term **OPTIONAL** are shown in **SMALL CAPITALS**.

**Note**: Do not confuse these ARM-specific uses of **OPTIONAL** with other uses of **optional**, where it has its usual meaning. These include:

- Optional arguments in the syntax of many instructions.
- Behavior determined by an implementation choice, for example the optional byte order reversal in an ARMv7-R implementation, where the SCTL.R.IE bit indicates the implemented option.

*See also* Deprecated.

**PA**

*See* Physical address (PA).

**PE**

*See* Processing element (PE).

**Physical address (PA)**

An address that identifies a location in the physical memory map.

*See also* Intermediate Physical Address (IPA), Virtual address (VA).

**PoC**

*See* Point of coherency (PoC).

**PoU**

*See* Point of unification (PoU).

**Point of coherency (PoC)**

For a particular MVA, the point at which all agents that can access memory are guaranteed to see the same copy of a memory location. For more information see *Terms used in describing the maintenance instructions on page D3-1696*.

**Point of unification (PoU)**

For a particular PE, the point by which the instruction and data caches and the translation table walks of that PE are guaranteed to see the same copy of a memory location. For more information see *Terms used in describing the maintenance instructions on page D3-1696*.

**Post-indexed addressing**

Means that the memory address is the base register value, but an offset is added to or subtracted from the base register value and the result is written back to the base register.

**Prefetching**

Prefetching refers to speculatively fetching instructions or data from the memory system. In particular, instruction prefetching is the process of fetching instructions from memory before the instructions that precede them, in simple sequential execution of the program, have finished executing. Prefetching an instruction does not mean that the instruction has to be executed.

In this manual, references to instruction or data fetching apply also to prefetching, unless the context explicitly indicates otherwise.

**Note**

The Prefetch Abort exception can be generated on any instruction fetch, and is not limited to speculative instruction fetches.

*See also* Simple sequential execution.
**Pre-indexed addressing**

Means that the memory address is formed in the same way as for offset addressing, but the memory address is also written back to the base register.

**Processing element (PE)**

The abstract machine defined in the ARM architecture, as documented in an ARM Architecture Reference Manual. A PE implementation compliant with the ARM architecture must conform with the behaviors described in the corresponding ARM Architecture Reference Manual.

**Protection region**

A memory region whose position, size, and other properties are defined by Memory Protection Unit registers.

**Protection Unit**

See Memory Protection Unit (MPU).

**Pseudo-instruction**

UAL assembler syntax that assembles to an instruction encoding that is expected to disassemble to a different assembler syntax, and is described in this manual under that other syntax. For example, MOV <Rd>, <Rm>, LSL #<n> is a pseudo-instruction that is expected to disassemble as LSL <Rd>, <Rm>, #<n>.

**PSTATE**

An abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

See also Condition flags.

**Quadword**

A 128-bit data item. Quadwords are normally at least word-aligned in ARM systems.

**Quadword-aligned**

Means that the address is divisible by 16.

**Quiet NaN**

A NaN that propagates unchanged through most floating-point operations.

**RAO**

See Read-As-One (RAO).

**RAZ**

See Read-As-Zero (RAZ).

**RAO/SBOP**

In versions of the ARM architecture before ARMv8, Read-As-One, Should-Be-One-or-Preserved on writes.

In ARMv8, RES1 replaces this description.

See also UNK/SBOP, Read-As-One (RAO), Should-Be-One-or-Preserved (SBOP).

**RAO/WI**

Read-As-One, Writes Ignored.

Hardware must implement the field as read as Read-as-One, and must ignore writes to the field.

Software can rely on the field reading as all 1s, and on writes being ignored.

This description can apply to a single bit that reads as 1, or to a field that reads as all 1s.

See also Read-As-One (RAO).

**RAZ/SBZP**

In versions of the ARM architecture before ARMv8, Read-As-Zero, Should-Be-Zero-or-Preserved on writes.

In ARMv8, RES0 replaces this description.

See also UNK/SBZP, Read-As-Zero (RAZ), Should-Be-Zero-or-Preserved (SBZP).

**RAZ/WI**

Read-As-Zero, Writes Ignored.

Hardware must implement the field as Read-as-Zero, and must ignore writes to the field.

Software can rely on the field reading as all 0s, and on writes being ignored.

This description can apply to a single bit that reads as 0, or to a field that reads as all 0s.

See also Read-As-Zero (RAZ).

**Read-allocate cache**

A cache in which a cache miss on reading data causes a cache line to be allocated into the cache.
Read-As-One (RAO)
Hardware must implement the field as reading as all 1s.

Software:
• Can rely on the field reading as all 1s.
• Must use a SBOP policy to write to the field.

This description can apply to a single bit that reads as 1, or to a field that reads as all 1s.

Read-As-Zero (RAZ)
Hardware must implement the field as reading as all 0s.

Software:
• Can rely on the field reading as all 0s
• Must use a SBZP policy to write to the field.

This description can apply to a single bit that reads as 0, or to a field that reads as all 0s.

Read, modify, write
In a read, modify, write instruction sequence, a value is read to a general-purpose register, the relevant fields updated in that register, and the new value written back.

RES0
A reserved bit or field with Should-Be-Zero-or-Preserved (SBZP) behavior. Used for fields in register descriptions, and for fields in architecturally-defined data structures that are held in memory, for example in translation table descriptors.

--- Note ---
RES0 is not used in descriptions of instruction encodings.

Within the architecture, there are some cases where a register bit or bitfield:
• Is RES0 in some defined architectural context.
• Has different defined behavior in a different architectural context.

This means the definition of RES0 for register fields is:

If a bit is RES0 in all contexts
It is implementation defined whether:
1. The bit is hardwired to 0. In this case:
   • Reads of the bit always return 0.
   • Writes to the bit are ignored.
2. The bit can be written. In this case:
   • An indirect write to the register sets the bit to 0.
   • A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.
     If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
     • A direct write to the bit must update a storage location associated with the bit.
     • The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

Whether RES0 bits or fields follow behavior 1 or behavior 2 is implementation defined on a field-by-field basis.
If a bit is RES0 only in some contexts

When the bit is described as RES0:

- An indirect write to the register sets the bit to 0.
- A read of the bit must return the value last successfully written to the bit, by either a direct or an indirect write, regardless of the use of the register when the bit was written.
  If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
- A direct write to the bit must update a storage location associated with the bit.
- While the use of the register is such that the bit is described as RES0, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

A bit that is RES0 in a context is reserved for possible future use in that context. To preserve forward compatibility, software:

- Must not rely on the bit reading as 0.
- Must use an SBZP policy to write to the bit.

The RES0 description can apply to bits or bitfields that are read-only, or are write-only:

- For a read-only bit, RES0 indicates that the bit reads as 0, but software must treat the bit as UNKNOWN.
- For a write-only bit, RES0 indicates that software must treat the bit as SBZ.

This RES0 description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

In body text, the term RES0 is shown in SMALL CAPITALS.

See also Read-As-Zero (RAZ), Should-Be-Zero-or-Preserved (SBZP), UNKNOWN.

RES1

A reserved bit or field with Should-Be-One-or-Preserved (SBOP) behavior. Used for fields in register descriptions, and for fields in architecturally-defined data structures that are held in memory, for example in translation table descriptors.

--- Note ---

RES1 is not used in descriptions of instruction encodings.

Within the architecture, there are some cases where a register bit or bitfield:

- Is RES1 in some defined architectural context.
- Has different defined behavior in a different architectural context.

This means the definition of RES1 for register fields is:

If a bit is RES1 in all contexts

It is IMPLEMENTATION DEFINED whether:

1. The bit is hardwired to 1. In this case:
   - Reads of the bit always return 1.
   - Writes to the bit are ignored.
2. The bit can be written. In this case:
   - An indirect write to the register sets the bit to 1.
   - A read of the bit returns the last value successfully written, by either a direct or an indirect write, to the bit.
     If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
   - A direct write to the bit must update a storage location associated with the bit.
• The value of the bit must have no effect on the operation of the PE, other than determining the value read back from the bit, unless this Manual explicitly defines additional properties for the bit.

Whether RES1 bits or fields follow behavior 1 or behavior 2 is IMPLEMENTATION DEFINED on a field-by-field basis.

If a bit is RES1 only in some contexts

When the bit is described as RES1:
• An indirect write to the register sets the bit to 1.
• A read of the bit must return the value last successfully written to the bit, regardless of the use of the register when the bit was written.

Note

As indicated in this list, this value might be written by an indirect write to the register.

If the bit has not been successfully written since reset, then the read of the bit returns the reset value if there is one, or otherwise returns an UNKNOWN value.
• A direct write to the bit must update a storage location associated with the bit.
• While the use of the register is such that the bit is described as RES1, the value of the bit must have no effect on the operation of the PE, other than determining the value read back from that bit, unless this Manual explicitly defines additional properties for the bit.

A bit that is RES1 in a context is reserved for possible future use in that context. To preserve forward compatibility, software:
• Must not rely on the bit reading as 1.
• Must use an SBOP policy to write to the bit.

The RES1 description can apply to bits or bitfields that are read-only, or are write-only:
• For a read-only bit, RES1 indicates that the bit reads as 0, but software must treat the bit as UNKNOWN.
• For a write-only bit, RES1 indicates that software must treat the bit as SBO.

This RES1 description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

In body text, the term RES1 is shown in SMALL CAPITALS.

See also Read-As-One (RAO), Should-Be-One-or-Preserved (SBOP), UNKNOWN.

Reserved

Unless otherwise stated:
• Instructions that are reserved or that access reserved registers have UNPREDICTABLE behavior.
• Bit positions described as reserved are:
  — In an RW register, RES0.
  — In an RO register, UNK.
  — In a WO register, RES0.

RISC

Reduced Instruction Set Computer.

Rounding error

The value of the rounded result of an arithmetic operation minus the exact result of the operation.

Rounding mode

Specifies how the exact result of a floating-point operation is rounded to a value that is representable in the destination format. The rounding modes are defined by the IEEE 754 specification, see Floating-point standards, and terminology on page A1-50.

Saturated arithmetic

Integer arithmetic in which a result that would be greater than the largest representable number is set to the largest representable number, and a result that would be less than the smallest representable number is set to the smallest representable number. Signed saturated arithmetic is often used in DSP algorithms. It contrasts with the normal signed integer arithmetic used in ARM processors, in which overflowing results wrap around from $+2^{31} - 1$ to $-2^{31}$ or vice versa.
SBO See Should-Be-One (SBO).

SBOP See Should-Be-One-or-Preserved (SBOP).

SBZ See Should-Be-Zero (SBZ).

SBZP See Should-Be-Zero-or-Preserved (SBZP).

Security hole A mechanism by which execution at the current level of privilege can achieve an outcome that cannot be achieved at the current or a lower level of privilege using instructions that are not UNPREDICTABLE. The ARM architecture forbids security holes.

Self-modifying code Code that writes one or more instructions to memory and then executes them. When using self-modifying code you must use cache maintenance and barrier instructions to ensure synchronization. For more information see Caches and memory hierarchy on page B2-72.

Set See Cache sets.

Should-Be-One (SBO) Hardware must ignore writes to the field.

ARM strongly recommends that software writes the field as all 1s. If software writes a value that is not all 1s, it must expect an UNPREDICTABLE result.

This description can apply to a single bit that should be written as 1, or to a field that should be written as all 1s.

Should-Be-One-or-Preserved (SBOP) From the introduction of the ARMv8 architecture, the description Should-Be-One-or-Preserved (SBOP) is superseded by RES1.

Note The ARMv7 Large Physical Address Extension modified the definition of SBOP for register bits that are SBOP in some but not all contexts. The behavior of these bits is covered by the RES1 definition, but not by the generic definition of SBOP given here.

Hardware must ignore writes to the field.

If software has read the field since the PE implementing the field was last reset and initialized, it must preserve the value of the field by writing the value that it previously read from the field. Otherwise, it must write the field as all 1s.

If software writes a value to the field that is not a value previously read for the field and is not all 1s, it must expect an UNPREDICTABLE result.

This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

Should-Be-Zero (SBZ) Hardware must ignore writes to the field.

ARM strongly recommends that software write the field as all 0s. If software writes a value that is not all 0s, it must expect an UNPREDICTABLE result.

This description can apply to a single bit that should be written as 0, or to a field that should be written as all 0s.

Should-Be-Zero-or-Preserved (SBZP) From the introduction of the ARMv8 architecture, the description Should-Be-Zero-or-Preserved (SBZP) is superseded by RES0.

Note The ARMv7 Large Physical Address Extension modified the definition of SBZP for register bits that are SBZP in some but not all contexts. The behavior of these bits is covered by the RES0 definition, but not by the generic definition of SBZP given here.
Hardware must ignore writes to the field.

If software has read the field since the PE implementing the field was last reset and initialized, it must preserve the value of the field by writing the value that it previously read from the field. Otherwise, it must write the field as all 0s.

If software writes a value to the field that is not a value previously read for the field and is not all 0s, it must expect an UNPREDICTABLE result.

This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

**Signaling NaNs**

Cause an Invalid Operation exception whenever any floating-point operation receives a signaling NaN as an operand. Signaling NaNs can be used in debugging, to track down some uses of uninitialized variables.

**Signed immediate and offset fields**

Are encoded in two’s complement notation unless otherwise stated.

**SIMD**

Single-Instruction, Multiple-Data.

The SIMD instructions in AArch32 state are:

- The instructions summarized in *Parallel addition and subtraction instructions* on page F1-2488.
- The Advanced SIMD instructions summarized in *Advanced SIMD and floating-point instructions* on page E1-2393, when operating on vectors.

---

**Simple sequential execution**

The behavior of an implementation that fetches, decodes and completely executes each instruction before proceeding to the next instruction. Such an implementation performs no speculative accesses to memory, including to instruction memory. The implementation does not pipeline any phase of execution. In practice, this is the theoretical execution model that the architecture is based on, and ARM does not expect this model to correspond to a realistic implementation of the architecture.

**Single-copy atomicity**

The form of atomicity described in *Single-copy atomicity* on page B2-81.

*See also* Atomicity, Multi-copy atomicity.

**Single-precision value**

A 32-bit word that is interpreted as a basic single-precision floating-point number according to the IEEE 754 standard.

**Spatial locality**

The observed effect that after a program has accessed a memory location, it is likely to also access nearby memory locations in the near future. Caches with multi-word cache lines exploit this effect to improve performance.

**T32 instruction**

One or two halfwords that specify an operation to be performed by a PE that is executing in an Exception level that is using AArch32 and is in T32 state. T32 instructions must be halfword-aligned.

T32 instructions were previously called Thumb instructions.

*See also* A32 instruction, A64 instruction, T32 state.

**T32 state**

The AArch32 Instruction set state in which the PE executes T32 instructions.

T32 state was previously called Thumb state.

*See also* A32 state, T32 instruction.

**Temporal locality**

The observed effect that after a program has accesses a memory location, it is likely to access the same memory location again in the near future. Caches exploit this effect to improve performance.
Thumb instruction
See T32 instruction.

TLB
See Translation Lookaside Buffer (TLB).

TLB lockdown
A way to prevent specific translation table walk results being accessed. This ensures that accesses to the associated memory areas never cause a translation table walk.

Translation Lookaside Buffer (TLB)
A memory structure containing the results of translation table walks. They help to reduce the average cost of a memory access. Usually, there is a TLB for each memory interface of the ARM implementation.

Translation table
A table held in memory that defines the properties of memory areas of various sizes from 1KB to 1MB.

Translation table walk
The process of doing a full translation table lookup. It is performed automatically by hardware.

Trap enable bits
In VFPv2, VFPv3U, and VFPv4U, determine whether trapped or untrapped exception handling is selected. If trapped exception handling is selected, the way it is carried out is IMPLEMENTATION DEFINED.

Unaligned
An unaligned access is an access where the address of the access is not aligned to the size of an element of the access.

Unaligned memory accesses
Are memory accesses that are not, or might not be, appropriately halfword-aligned, word-aligned, or doubleword-aligned.

Unallocated
Except where otherwise stated in this manual, an instruction encoding is unallocated if the architecture does not assign a specific function to the entire bit pattern of the instruction, but instead describes it as CONSTRAINED UNPREDICTABLE, UNDEFINED, UNPREDICTABLE, or an unallocated hint instruction.

A bit in a register is unallocated if the architecture does not assign a function to that bit.

UNDEFINED
Indicates an instruction that generates an Undefined Instruction exception.

In body text, the term UNDEFINED is shown in SMALL CAPITALS.

See also Undefined Instruction exception on page G1-3875.

Unified cache
Is a cache used for both processing instruction fetches and processing data loads and stores.

Unindexed addressing
Means addressing in which the base register value is used directly as the virtual address to send to memory, without adding or subtracting an offset. In most types of load/store instruction, unindexed addressing is performed by using offset addressing with an immediate offset of 0. The LDC, LDC2, STC, and STC2 instructions have an explicit unindexed addressing mode that permits the offset field in the instruction to specify additional coprocessor options.

UNK
An abbreviation indicating that software must treat a field as containing an UNKNOWN value.

Hardware must implement the bit as read as 0, or all 0s for a bit field. Software must not rely on the field reading as zero.

See also UNKNOWN.

UNK/SBOP
Hardware must implement the field as Read-As-One, and must ignore writes to the field.

Software must not rely on the field reading as all 1s, and except for writing back to the register it must treat the value as if it is UNKNOWN. Software must use an SBOP policy to write to the field.

This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

See also Read-As-One (RAO), Should-Be-One-or-Preserved (SBOP), UNKNOWN.

UNK/SBZP
Hardware must implement the bit as Read-As-Zero, and must ignore writes to the field.

Software must not rely on the field reading as all 0s, and except for writing back to the register it must treat the value as if it is UNKNOWN. Software must use an SBZP policy to write to the field.
This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

See also Read-As-Zero (RAZ), Should-Be-Zero-or-Preserved (SBZP), UNKNOWN.

UNKNOWN
An UNKNOWN value does not contain valid data, and can vary from moment to moment, instruction to instruction, and implementation to implementation. An UNKNOWN value must not return information that cannot be accessed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE and do not return UNKNOWN values.

An UNKNOWN value must not be documented or promoted as having a defined value or effect.

In body text, the term UNKNOWN is shown in SMALL CAPITALS.

See also UNK.

UNPREDICTABLE
Means the behavior cannot be relied upon. UNPREDICTABLE behavior must not perform any function that cannot be performed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE.

UNPREDICTABLE behavior must not be documented or promoted as having a defined effect.

An instruction that is UNPREDICTABLE can be implemented as UNDEFINED.

Execution in a Non-secure EL1 or EL0 mode of an instruction that is UNPREDICTABLE can be implemented as generating a Hyp Trap exception, provided that at least one instruction that is not UNPREDICTABLE causes a Hyp Trap exception.

In body text, the term UNPREDICTABLE is shown in SMALL CAPITALS.

See also CONSTRAINED UNPREDICTABLE.

VA
See Virtual address (VA).

VFP
In ARMv7, an extension to the ARM architecture, that provides single-precision and double-precision floating-point arithmetic.

Virtual address (VA)
An address generated by an ARM PE. This means it is an address that might be held in the program counter of the PE. For a PMSA implementation, the virtual address is identical to the physical address.

See also Intermediate Physical Address (IPA), Physical address (PA).

Watchpoint
A debug event triggered by an access to memory, specified in terms of the address of the location in memory being accessed.

Way
See Cache way.

WI
Writes Ignored. In a register that software can write to, a WI attribute applied to a bit or field indicates that the bit or field ignores the value written by software and retains the value it had before that write.

See also RAO/WI, RAZ/WI, RES0, RES1.

Word
A 32-bit data item. Words are normally word-aligned in ARM systems.

Word-aligned
Means that the address is divisible by 4.

Write-allocate cache
A cache in which a cache miss on storing data causes a cache line to be allocated into the cache.

Write-back cache
A cache in which when a cache hit occurs on a store access, the data is only written to the cache. Data in the cache can therefore be more up-to-date than data in main memory. Any such data is written back to main memory when the cache line is cleaned or reallocated. Another common term for a write-back cache is a copy-back cache.

Write-through cache
A cache in which when a cache hit occurs on a store access, the data is written both to the cache and to main memory. This is normally done via a write buffer, to avoid slowing down the PE.
| **Write buffer** | A block of high-speed memory that optimizes stores to main memory. |
